# Saturated and primitive smooth compactifications of ball quotients

P. G. Beshkov, A. K. Kasparian, \* and G. K. Sankaran<sup>†</sup>

Let  $X_i = (\mathbb{B}/\Gamma)'$ ,  $1 \leq i \leq 2$  be smooth toroidal compactifications of quotients  $\mathbb{B}/\Gamma_i$  of the complex 2-ball

$$\mathbb{B} = \{(z_1, z_2) \in \mathbb{C}^2 \mid |z_1|^2 + |z_2|^2 < 1\} = \mathrm{PSU}_{2,1}/\mathrm{PS}(U_2 \times U_1)$$

by lattices  $\Gamma < PU(2,1), D^{(i)} := X_i \setminus (\mathbb{B}/\Gamma_i)$  be the toroidal compactifying divisors and  $\rho_i: X_i \to Y_i$  be compositions of blow downs with exceptional divisors  $E(\rho_i)$  onto minimal surfaces  $Y_i$ . The present note establishes a bijective correspondence between the unramified coverings  $f: X_2 \to X_1$  of degree d, which restrict to unramified coverings  $f: D^{(2)} \to D^{(1)}, f: E(\rho_2) \to E(\rho_1)$  of degree d and the unramified coverings  $\varphi: Y_2 \to Y_1$ of degree d of the corresponding minimal models, which restrict to unramified coverings  $\varphi: \rho_2(D^{(2)}) \to \rho_1(D^{(1)}), \varphi: \rho_2(E(\rho_2) \to \rho_1(E(\rho_1)))$  of degree d. The aforementioned covering relations among  $X_i$  define an artinian partial order  $\geq$  on the set S of the smooth toroidal compactifications  $X = (\mathbb{B}/\Gamma)'$ . The maximal elements with respect to  $\succeq$  are called saturated and the minimal elements with respect to  $\geq$  are said to be primitive. Our considerations reduce the study of  $X \in \mathcal{S}$  to the study of the primitive  $X \in \mathcal{S}$ . For an arbitrary totally ordered subset  $\{X_{\alpha}\}_{\alpha\in A}\subset \mathcal{S}$ , all the minimal models  $Y_{\alpha}$  of  $X_{\alpha}$  have one and a same universal cover and one and a same Kodaira dimension. We discuss the saturated and the primitive  $X \in \mathcal{S}$  of non-positive Kodaira dimension. The covering relations among the smooth toroidal compactifications  $(\mathbb{B}/\Gamma)'$  are studies in Uludag's [Uludag], Stover's [Stover], Di Cerbo and Stover's [DiCerboStover1] and other articles.

Here is a synopsis of the article. Let  $\rho_1 : X_1 \to Y_1$  be a composition of blow downs of a smooth projective surface  $X_1$  onto a smooth projective surface  $Y_1$ . The first section establishes a bijective correspondence between the unramified coverings  $f : X_2 \to X_1$  of degree d and the unramified covering  $\varphi : Y_2 \to Y_1$  of degree d through fibered product commutative diagrams (4) with appropriate compositions of blow downs  $\rho_2 : X_2 \to Y_2$ . In order to induce  $\varphi : Y_2 \to Y_1$  by  $f : X_2 \to X_1$ , one observes that  $\varphi \rho_2$  is the Stein factorization of the proper holomorphic map  $\rho_1 f : X_2 \to Y_1$ . If  $D^{(i)} \subset X_i$  are (possibly reducible) divisors, which do not contain irreducible components of the exceptional divisors  $E(\rho_i)$  of  $\rho_i : X_i \to Y_i$ , then f is shown to restrict to an unramified covering  $f : D^{(2)} \to D^{(1)}$  of degree d if and only if  $\varphi$  restricts to an unramified covering  $\varphi : \rho_2(D^{(2)}) \to \rho_1(D^{(1)})$  of degree d. In particular, if  $\rho_1 : X_1 = (\mathbb{B}/\Gamma_1)' \to Y_1$  is a composition of blow downs of a smooth

toroidal compactification  $X_1 = (\mathbb{B}/\Gamma_1)'$  onto a minimal surface  $Y_1$  then the unramified coverings  $f : X_2 = (\mathbb{B}/\Gamma_2)' \to (\mathbb{B}/\Gamma_1)' = X_1$  of degree d, which restrict to unramified coverings  $f : \mathbb{B}/\Gamma_2 \to \mathbb{B}/\Gamma_2$  of degree d are in a bijective correspondence with the unramified coverings  $\varphi : Y_2 \to Y_1$  by appropriate minimal models  $Y_2$  of  $X_2$ . Under the aforementioned correspondence, f restricts to an unramified covering  $f : D^{(2)} = X_2 \setminus (\mathbb{B}/\Gamma_2) \to X_1 \setminus (\mathbb{B}/\Gamma_1) =$  $D^{(1)}$  of degree d of the corresponding compactifying divisors if and only if  $\varphi$  restricts to an unramified covering  $\varphi : \rho_2(D^{(2)}) \to \rho_1(D^{(1)})$  of degree d. In such a way, the presence of a finite unramified cover  $X_2 = (\mathbb{B}/\Gamma_2)'$  of  $X_1 = (\mathbb{B}/\Gamma_1)'$  can be detected by the means of an arbitrary minimal model  $Y_1$  of  $X_1$  and its finite unramified covers  $Y_2$ .

Let  $X_2, Y_2$  be smooth projective surfaces and  $\rho_2 = \beta_1 \dots \beta_r : X_2 \to Y_2$  be a commposition of blow downs with exceptional divisors  $E(\beta i) \subset \beta_{i+1} \ldots \beta_r(X_2)$ . The second section introduces compatibility conditions on the finite unramified coverings  $f: X_2 \to f(X_2)$  or  $\varphi: Y_2 \to \varphi(Y_2)$  with  $\rho_2$  in such a way that the existence of  $f: X_2 \to f(X_2)$  to be equivalent to the existence of  $\varphi: Y_2 \to \varphi(Y_2)$ . In particular, for a smooth toroidal compactification  $X_2 = (\mathbb{B}/\Gamma_2)'$  with toroidal compactifying divisor  $D^{(2)} := X_2 \setminus (\mathbb{B}/\Gamma_2)$  and a composition of blow downs  $\rho_2 = \beta_1 \dots \beta_r : X_2 \to Y_2$  onto a minimal surface  $Y_2$ , there exists an unramified covering  $f: X_2 \to f(X_2) =: X_1$ , which is compatible with  $\rho_2$  and restricts to an unramified covering  $f: \mathbb{B}/\Gamma_2 \to f(\mathbb{B}/\Gamma_2)$  of degree d if and only if there is an unramified covering  $\varphi: Y_2 \to \varphi(Y_2) =: Y_1$  of a minimal model  $Y_1$  of  $X_1$ , which is compatible with  $\rho_2$  and restricts to an unramified covering  $\varphi: \rho_2(D^{(2)}) \to \varphi \rho_2(D^{(2)})$  of degree d. Moreover,  $X_1 = (\mathbb{B}/\Gamma_1)'$  is a smooth toroidal compactification and if  $\rho_1: X_1 \to Y_1$  is a composition of blow downs onto  $Y_1$  then  $\varphi \rho_2(D^{(2)}) = \rho(D^{(1)})$  for the compactifying divisor  $D^{(1)} := X_1 \setminus (\mathbb{B}/\Gamma_1)$  of  $\mathbb{B}/\Gamma_1$ . A smooth toroidal compactification  $X = (\mathbb{B}/\Gamma)'$  is primitive if there is no unramified covering  $f: X \to f(X)$  of degree d, which restricts to an unramified covering  $f: \mathbb{B}/\Gamma \to f(\mathbb{B}/\Gamma)$ of degree d and is compatible with some composition of blow downs  $\rho: X \to Y$  onto a minimal surface Y. Due to the established duality between the finite unramified coverings  $f: X \to f(X)$  and  $\varphi: Y \to \varphi(Y)$  of one and a same degree, the primitiveness of  $X = (\mathbb{B}/\Gamma)'$ can be detected by the properties of Y.

The last, third section studies the finite unramified Galois coverings  $f: X = (\mathbb{B}/\Gamma)' \to$ f(X) of smooth toroidal compactifications  $X = (\mathbb{B}/\Gamma)'$ , which admit a blow down  $\beta$ :  $X \to Y$  of  $n \in \mathbb{N}$  smooth irreducible rational (-1)-curves onto a minimal surface Y. Di Cerbo and Stover have shown in [DiCerboStover2] that the smooth toroidal compactifications  $X = (\mathbb{B}/\Gamma)'$  with abelian or bi-elliptic minimal model Y have the aforementioned property. We establish that for such  $X = (\mathbb{B}/\Gamma)'$  the compatibility of the unramified coverings  $\varphi$ :  $Y \to \varphi(Y)$  of degree d, restricting to unramified coverings  $\varphi : \beta(D) \to \varphi\beta(D)$  of degree d with  $\beta: X \to Y$  is automatic, as far as  $\beta(E(\beta)) = \beta(D)^{\text{sing}}$  coincides with the singular locus of  $\beta(D)$ . The relative automorphism group  $\operatorname{Aut}(Y,\beta(D)) = \operatorname{Aut}(Y,\beta(D),\beta(D)^{\operatorname{sing}})$ admits an isomorphism  $\Phi$ : Aut $(Y,\beta(D)) \rightarrow$  Aut(X,D) onto the relative automorphism group  $\operatorname{Aut}(X, D) = \operatorname{Aut}(X, D, E(\beta))$ . Let  $N(\pi_1(Y))$  be the normalizer of the fundamental group  $\pi_1(Y)$  of Y in the biholomorphism group  $\operatorname{Aut}(Y)$  of the universal cover Y of Y. It is well known that the biholomorphism group Aut(Y) of Y is the quotient Aut(Y) = $N(\pi_1(Y))/\pi_1(Y)$ . If an unramified covering  $\varphi: Y \to \varphi(Y)$  of degree d restricts to an unramified covering  $\varphi: \beta(D) \to \varphi\beta(D)$  of degree d then any  $g_o \in N(\pi_1(Y)) \cap \pi_1(\varphi(Y))$ is shown to induce a biholomorphism  $\overline{g_o} := g_o \pi_1(Y) : \beta(D) \to \beta(D)$  and, therefore, a factorization  $f = f_o \zeta$  of the associated unramified covering  $f : X = (\mathbb{B}/\Gamma)' \to X_0 =$   $(\mathbb{B}/\Gamma_0)'$  of  $\varphi : Y \to \varphi(Y)$  through the unramified Galois covering  $\zeta : X \to X/\langle \Phi(g_o) \rangle$ and an unramified covering  $f_o : X/\langle \Phi(g_o) \rangle \to X_0 = (\mathbb{B}/\Gamma_0)'$ . In particular, for a smooth toroidal compactification  $X = (\mathbb{B}/\Gamma)'$  with abelian minimal model Y, we establish that any unramified covering  $f : X = (\mathbb{B}/\Gamma)' \to X_0 = (\mathbb{B}/\Gamma_0)'$  of degree d, which restricts to an unramified covering  $f : \mathbb{B}/\Gamma \to \mathbb{B}/\Gamma_0$  of degree d, factors through a Galois covering  $X \to X/\langle g \rangle, g \in \operatorname{Aut}(X, D)$ , which restricts to a Galois covering  $\mathbb{B}/\Gamma \to (\mathbb{B}/\Gamma)/\langle g \rangle$ . The third section discusses also the saturation and the primitiveness of the smooth toroidal compactifications  $X = (\mathbb{B}/\Gamma)'$  with Kodaira dimension  $\kappa(X) = -\infty$ , as well as the smooth toroidal compactifications  $X = (\mathbb{B}/\Gamma)'$  with K3 or Enriques minimal model.

#### 1 Unramified pull back of a smooth compactification

**Lemma 1.** Let M be a complex manifold and N be a complex analytic subvariety of M or an open subset of M.

(i) If  $f: M \to f(M)$  is an unramified covering of degree d then  $f: N \to f(N)$  is an unramified covering of degree d exactly when  $f: M \setminus N \to f(M) \setminus f(N)$  is an unramified covering of degree d.

(ii) Let us suppose that  $f: M \to f(M)$  is a holomorphic map onto a complex manifold,  $f(N) \cap f(M \setminus N) = \emptyset$  and  $f: N \to f(N), f: M \setminus N \to f(M \setminus N)$  are unramified coverings of degree d. Then  $f: M \to f(M)$  is an unramified covering of degree d.

Proof. (i) Let X := N or  $X := M \setminus X$ . Then  $f : X \to f(X)$  is an unramified covering of degree  $\deg(f|_X) = \deg(f|_M) = d$  exactly when  $f^{-1}(f(X)) = X$ . If so, then the intersection  $f^{-1}(f(M \setminus X)) \cap X = \emptyset$  is empty, whereas  $f^{-1}(f(M \setminus X)) = M \setminus X$ , the union  $f(M) = f(X) \coprod f(M \setminus X)$  is disjoint and  $f : M \setminus X \to f(M \setminus X) = f(M) \setminus f(X)$  is an unramified covering of degree d.

(ii) The union  $f(M) = f(N) \coprod f(M \setminus N)$  is disjoint, so that  $f^{-1}(f(M \setminus N)) = M \setminus N$ ,  $f^{-1}(f(N)) = N$  and  $f: M \to f(M)$  is an unramified covering of degree d.

**Lemma 2.** Let  $f : X \to X'$  be an unramified covering of degree d of smooth projective surfaces.

(i) Suppose that  $D = \prod_{j=1}^{k} D_j$  is a divisor on X with disjoint smooth irreducible components  $D_j$  and f restricts to an unramified covering  $f: D \to f(D)$  of degree d. Then  $f(D) = D_j$ 

 $D_j$  and f restricts to an unramified covering  $f: D \to f(D)$  of degree d. Then  $f(D) = \bigcup_{j=1}^k f(D_j)$  has smooth irreducible components  $f(D_j)$ , f restricts to unramified coverings  $f: D_j \to f(D_j)$  for all  $1 \le j \le k$  and  $f(D_i) \cap f(D_j) = \emptyset$  for  $f(D_i) \ne f(D_j)$ .

In particular,  $D_j$  are smooth elliptic curves of and only if  $f(D_j)$  are smooth elliptic curves.

(ii) If C' is a smooth irreducible rational curve on X' then the complete preimage  $f^{-1}(C') = \prod_{i=1}^{d} C_i$  consists of d disjoint smooth irreducible rational curves  $C_i$  and f restricts to isomorphisms  $f: C_i \to C'$  for all  $1 \le i \le d$ .

*Proof.* (i) The unramified covering  $f: D \to f(D)$  is a local biholomorphism, so that f(D) is a smooth divisor on X'. Thus, all the irreducible components  $f(D_j)$  of f(D) are smooth

curves and  $f(D_i) \cap f(D_j) \neq \emptyset$  requires  $f(D_i) \equiv f(D_j)$ . For any  $1 \le i \le k$  let J(i) be the set of those  $1 \le j \le k$ , for which  $f(D_j) \equiv f(D_i)$ . Then there exists a subset  $I \subseteq \{1, \ldots, k\}$  with  $\prod_{i \in I} J(i) = \{1, \ldots, k\}$  and  $f(D) = \prod_{i \in I} f(D_i)$ . By the very definition of J(i), there holds the inclusion  $\prod_{jijJ(i)} D_j \subseteq f^{-1}(f(D_i))$ . Since f restricts to an unramified covering  $f: D \to f(D)$  of degree d, any  $p \in f^{-1}(f(D_i))$  belongs to  $D_s$  for some  $1 \le s \le k$ . Then  $f(p) \in f(D_i)$  specified that  $s \in J(i)$ , whereas  $f^{-1}(f(D_i)) \subseteq \prod_{j \in J(i)} D_j$  and  $f^{-1}(f(D_i)) = \prod_{j \in J(i)} D_j$ . Thus, for any  $i \in I$  the morphism f restricts to an unramified covering  $f: \prod_{j \in J(i)} D_j \to f(D_i)$  of degree d. By definition, any  $f(p) \in f(D_i)$  with  $p \in \prod_{j \in J(i)} D_j$  has a trivializing neighborhood U on  $f(D_i)$ , whose pull back  $f^{-1}(U) = \prod_{q \in f^{-1}(p)} V_q$  is a disjoint union of neighborhoods  $V_q$  of  $q \in f^{-1}(p)$  on  $\prod_{j \in J(i)} D_j$  with biholomorphic restrictions  $f: V_q \to U$ . For a sufficiently small U one can assume that  $V_q \subset D_j$  for  $q \in D_j$ . That is why f restricts to unramified coverings  $f: D_j \to f(D_j) = f(D_i)$ . In particular,  $D_j$  are smooth elliptic curves exactly when  $f(D_j)$  are smooth elliptic curves.

(ii) Let  $f^{-1}(C') = \sum_{i=1}^{k} C_i$  be a union of k irreducible corves  $C_i, d_i := \deg[f|_{C_i} : C_i \to C']$ and  $\operatorname{Br}(f|_{C_i}) := \{q \in C' \mid |f^{-1}(q) \cap C_i| < d_i\}$  be the branch locus of  $f|_{C_i}$  for  $1 \le i \le k$ . Any  $\operatorname{Br}(f|_{C_i})$  is a finite set, as well as the intersection  $\bigcup_{1 \le i < j \le k} C_i \cap C_j$  of different irreducible components, so that

$$\Sigma := \left[ \bigcup_{i=1}^{k} \operatorname{Br}(f|_{C_i}) \right] \cup \left[ \bigcup_{1 \le i < j \le k} f(C_i \cap C_j) \right]$$

is a finite subset of C'. For any  $q \in C' \setminus \Sigma$  one has  $f^{-1}(q) = \prod_{i=1}^{k} f^{-1}(q) \cap C_i$ , whereas

$$d = \left| f^{-1}(q) \right| = \sum_{i=1}^{k} \left| f^{-1}(q) \cap C_i \right| = \sum_{i=1}^{k} d_i.$$

If  $q_j \in Br(f|_{C_j})$  then  $f^{-1}(q_j) = \bigcup_{i=1}^k f^{-1}(q_j) \cap C_i$  with  $|f^{-1}(q_j) \cap C_j| < d_j$ , so that

$$d = \left| f^{-1}(q_j) \right| \le \sum_{i=1}^k \left| f^{-1}(q_j) \cap C_i \right| < \sum_{i=1}^k d_i = d.$$

This is an absurd, justifying  $\operatorname{Br}(f|_{C_j}) = \emptyset$  for all  $1 \leq j \leq k$ . Similarly, for any  $p \in C_i \cap C_j$  there holds

$$d = \left| f^{-1}(p) \right| < \sum_{i=1}^{k} \left| f^{-1}(p) \cap C_i \right| = \sum_{i=1}^{k} d_i = d.$$

The contradiction shows that the irreducible components  $C_i$  of  $f^{-1}(C')$  are disjoint. The unramified coverings  $f|_{C_i}: C_i \to C'$  of the smooth irreducible rational curve C' are of degree  $d_i = 1$ , due to  $\pi_1(C') = \{1\}$ . Therefore  $d = \sum_{i=1}^k d_i = k$  and  $f^{-1}(C') = \prod_{i=1}^d C_i$  consists of d

disjoint smooth irreducible rational curves with biholomorphic restrictions  $f|_{C_i} : C_i \to C'$ for all  $1 \le i \le d$ .

A (-1)-curve  $L_i$  on a smooth projective surface Y is a smooth irreducible rational curve with self-intersection  $L_i^2 = -1$ . Throughout, we say that a smooth projective surface Y is minimal if it does not contain a (-1)-curve. This is slightly different from the contemporary viewpoint of the Minimal Model Program, which considers a smooth projective surface Y to be minimal if its canonical divisor  $K_Y$  is nef (i.e.,  $K_Y.C \ge 0$  for all effective curves  $C \subset Y$ ). The numerical effectiveness of  $K_Y$  excludes the existence of (-1)-curves on Y. If Y is of Kodaira dimension  $\kappa(Y) = -\infty$  then  $K_Y$  is not nef, regardless of the presence of (-1)curves on Y. That is the reason for exploiting the older, out of date notion of minimality of a smooth projective surface, which requires the non-existence of (-1)-curves on Y. By a theorem of Castelnuovo (Theorem V.5.7 [Ha]), for any smooth irreducible projective surface X there is a birational morphism  $\rho : X \to Y$  onto a minimal smooth projective surface Y, which is a composition of blow downs of (-1)-curves. If X is of Kodaira dimension  $\kappa(X) \ge 0$ then the minimal model Y of X is unique (up to an isomorphism). This is no more true when X is birational to a rational or a ruled surface.

**Lemma 3.** (i) Let  $Bl: X_1 \to Y_1$  be a blow down of a (-1)-curve  $L_1 \subset X_1$  and  $\varphi: Y_2 \to Y_1$  be an unramified covering of degree d. Then the fibered product commutative diagram

consists of an unramified covering  $f: X_2 \to X_1$  of degree d and the blow down  $\beta: X_2 \to Y_2$ of the disjoint union  $f^{-1}(L_1) = \prod_{j=1}^d L_{1,j}$  of the (-1)-curves  $L_{1,j}$ .

(ii) Let  $\rho_1$ : Bl<sub>1</sub>...Bl<sub>r-1</sub>Bl<sub>r</sub>:  $T_r := X_1 \to Y_1 =: T_0$  be a composition of blow downs Bl<sub>i</sub>:  $T_i \to T_{i-1}$  of (-1)-curves  $L_i \subset T_i$  and  $\varphi: Y_2 \to Y_1$  be an unramified covering of degree d. Then the fibered product commutative diagrams

fit into a commutative diagram

and induce a fibered product commutative diagram

with an unramified covering  $f: X_2 \to X_1$  of degree d and a composition  $\rho_2 = \beta_1 \dots \beta_{r-1} \beta_r$ :  $X_2 \to Y_2$  of blow downs of  $\varphi_i^{-1}(L_i) = \prod_{j=1}^d L_{i,j}$  for all  $1 \le i \le r$ .

*Proof.* (i) By the very definition of a blow down Bl :  $X_1 \to Y_1$  of  $L_1$  to Bl $(L_1) = q_1 \in Y_1$ , one has  $X_1 \setminus L_1 = Y_1 \setminus \{q_1\}$ . Then

$$X_2 := X_1 \times_{Y_1} Y_2 = [(X_1 \setminus L_1) \times_{Y_1} Y_2] \coprod [L_1 \times_{Y_1} Y_2]$$

decomposes into the disjoint union of

$$(X_1 \setminus L_1) \times_{Y_1} Y_2 = \{(x_1, y_2) \mid x_1 = \operatorname{Bl}(x_1) = \varphi(y_2)\} \simeq Y_2 \setminus \varphi^{-1}(q_1) \text{ and}$$
$$L_1 \times_{Y_1} Y_2 = \{(x_1, y_2) \mid q_1 = \operatorname{Bl}(x_1) = \varphi(y_2)\} = L_1 \times \varphi^{-1}(q_1).$$

If  $\varphi^{-1}(q_1) = \{p_{1,j} \mid 1 \leq j \leq d\}$  then  $X_2$  is the blow up of  $Y_2$  at  $\{p_{1,j} \mid 1 \leq j \leq d\}$ . Due to  $\operatorname{Bl} f = \varphi\beta$ , the exceptional divisor of  $\beta$  is  $\beta^{-1}(\{p_{1,j} \mid 1 \leq j \leq d\}) = \beta^{-1}\varphi^{-1}(q_1) = (\varphi\beta)^{-1}(q_1) = (\operatorname{Bl} f)^{-1}(q_1) = f^{-1}\operatorname{Bl}^{-1}(q_1) = f^{-1}(L_1) = \prod_{j=1}^d L_{1,j}$ . According to Corollary 17.7.3 (i) from Grothendieck's [Groth4],  $f : X_2 \to X_1$  is an unramified covering, since  $\varphi: Y_2 \to Y_1$  is an unramified covering.

(ii) By an increasing induction on  $1 \leq i \leq r$ , one applies (i) to the fibered product commutative diagrams (2) and justifies (ii).

**Lemma 4.** (i) In the notations from Lemma 3 (i) and the fibered product commutative diagram (1), let  $D^{(2)}$  be a (possibly reducible) divisor on  $X_2$ , which does not contain an irreducible component of the exceptional divisor of  $\beta$  and  $D^{(1)}$  be a (possibly reducible) divisor on  $X_1$ , which does not contain the exceptional divisor  $L_1$  of Bl. Then the restriction  $f : D^{(2)} \to D^{(1)}$  is an unramified covering of degree  $d = \deg[f : X_2 \to X_1]$  if and only if  $\varphi : \beta(D^{(2)}) \to \operatorname{Bl}(D^{(1)})$  is an unramified covering of degree d.

(ii) In the notations from Lemma 3 (ii) and the fibered product commutative diagram (4), let  $D^{(2)}$  be a (possibly reducible) divisor on  $X_2$ , which does not contain an irreducible component of the exceptional divisor of  $\rho_2$  and  $D^{(1)}$  be a (possibly reducible) divisor on  $X_1$ , which does not contain an irreducible component of the exceptional divisor of  $\rho_1$ . Then the restriction  $f: D^{(2)} \to D^{(1)}$  is an unramified covering of degree d if and only if the restriction  $\varphi: \rho_2(D^{(2)}) \to \rho_1(D^{(1)})$  is an unramified covering of degree d.

Proof. (i) If  $f: D^{(2)} \to D^{(1)}$  is an unramified covering of degree d then  $f^{-1}(D^{(1)} \cap L_1) = f^{-1}(D^{(1)}) \cap f^{-1}(L_1) = D^{(2)} \cap f^{-1}(L_1)$  and the restriction  $f: D^{(1)} \cap f^{-1}(L_1) \to D^{(1)} \cap L_1$  is an unramified covering of degree d. After denoting  $f^{-1}(L_1) = \prod_{j=1}^d L_{1,j}$ ,  $\beta(L_{1,j}) = p_{1,j}$  and  $Bl(L_1) = q_1$ , one applies Lemma 1 (i), in order to conclude that

$$\varphi \equiv f : \beta(D^{(2)}) \setminus \{p_{1,j} \mid 1 \le j \le d\} \equiv D^{(2)} \setminus f^{-1}(L_1) \longrightarrow D^{(1)} \setminus L_1 \equiv \operatorname{Bl}(D^{(1)}) \setminus \{q_1\}$$

is an unramified covering of degree d. Now,  $\varphi$  restricts to  $\varphi : \{p_{1,j} \mid 1 \leq j \leq d\} \to \{q_1\}$ , so that

$$\varphi:\beta(D^{(2)})=\beta(D^{(2)})\setminus\{p_{1,j}\mid 1\leq j\leq d\}\coprod\{p_{1,j}\mid 1\leq j\leq d\}\longrightarrow$$
$$\longrightarrow \left[\operatorname{Bl}(D^{(1)})\setminus\{q_1\}\right]\coprod\{q_1\}=\operatorname{Bl}(D^{(1)})$$

is an unramified covering of degree d by Lemma 1 (ii).

Conversely, assume that  $\varphi : \beta(D^{(2)}) \to \operatorname{Bl}(D^{(1)})$  is an unramified covering of degree d. Choose a sufficiently small neighborhood V of  $q_1 = \operatorname{Bl}(L_1)$  on  $Y_1$ , such that  $\varphi^{-1}(V) = \prod_{j=1}^{d} U_j$  is a disjoint union of neighborhoods  $U_j$  of  $p_{1,j}$ ,  $1 \leq j \leq d$  on  $Y_2$  with biholomorphic restrictions  $\varphi : U_j \to V$  of  $\varphi$ . Bearing in mind that  $\operatorname{Bl}_1 : X_1 \to Y_1$  is the blow up of  $Y_1$  at  $q_1$ , one decomposes

$$\operatorname{Bl}(D^{(1)}) = \left[\operatorname{Bl}(D^{(1)}) \setminus V\right] \coprod \left[\operatorname{Bl}(D^{(1)}) \cap V\right] \quad \text{and}$$
$$D^{(1)} = \left[\operatorname{Bl}(D^{(1)}) \setminus V\right] \coprod \operatorname{Bl}^{-1}(\operatorname{Bl}(D^{(1)}) \cap V).$$

Similarly,  $\beta : X_2 \to Y_2$  is the blow up of  $Y_2$  at  $\varphi^{-1}(q_1) = \{p_{1,j} \mid 1 \leq j \leq d\}$ , so that there are decompositions

$$\beta(D^{(2)}) = \left[\beta(D^{(2)}) \setminus \varphi^{-1}(V)\right] \coprod \left[\beta(D^{(2)}) \cap \varphi^{-1}(V)\right] \text{ and}$$
$$D^{(2)} = \left[\beta(D^{(2)}) \setminus \varphi^{-1}(V)\right] \coprod \beta^{-1}(\beta(D^{(2)}) \cap \varphi^{-1}(V)).$$

According to  $\varphi^{-1}(\operatorname{Bl}(D^{(1)}) \cap V) = \varphi^{-1}(\operatorname{Bl}(D^{(1)})) \cap \varphi^{-1}(V) = \beta(D^{(2)}) \cap \varphi^{-1}(V)$ , the restriction  $\varphi : \beta(D^{(2)}) \cap \varphi^{-1}(V) \to \operatorname{Bl}(D^{(1)}) \cap V$  is an unramified covering of degree d. Now, Lemma 1 (ii) applies to provide that

$$f \equiv \varphi : \beta(D^{(2)}) \setminus \varphi^{-1}(V) \longrightarrow \operatorname{Bl}(D^{(1)}) \setminus V$$

is an unramified covering of degree d. According to Lemma 1 (ii), it sufficed to show that

$$f: \beta^{-1}(\beta(D^{(2)}) \cap \varphi^{-1}(V)) \longrightarrow \operatorname{Bl}^{-1}(\operatorname{Bl}(D^{(1)}) \cap V)$$

is an unramified covering of degree d, in order to conclude that  $f: D^{(2)} \to D^{(1)}$  is an unramified covering of degree d. To this end, note that

$$\varphi^{-1}(\mathrm{Bl}(D^{(1)}) \cap V) = \beta(D^{(2)}) \cap \varphi^{-1}(V) = \beta(D^{(2)}) \cap \left(\prod_{j=1}^{d} U_j\right) = \prod_{j=1}^{d} \left[\beta(D^{(2)}) \cap U_j\right],$$

so that

$$\varphi : \prod_{j=1}^{d} \left[ \beta(D^{(2)}) \cap U_j \right] \longrightarrow \operatorname{Bl}(D^{(1)}) \cap V$$

is an unramified covering of degree d. Therefore, the biholomorphisms  $\varphi : U_j \to V$  restrict to biholomorphisms  $\varphi : \beta(D^{(2)}) \cap U_j \to \operatorname{Bl}(D^{(1)}) \cap V$ . According to  $\varphi(p_{1,j}) = q_1$ , there arise biholomorphisms

$$\varphi: (\beta(D^{(2)}) \cap U_j) \setminus \{p_{1,j}\} \longrightarrow (\mathrm{Bl}(D^{(1)}) \cap V) \setminus \{q_1\}.$$

By the very definition of a blow up at a point, these induce biholomorphisms

$$f: \left[ (\beta(D^{(2)}) \cap U_j) \setminus \{p_{1,j}\} \right] \coprod L_{1,j} \longrightarrow \left[ (\mathrm{Bl}(D^{(1)}) \cap V) \setminus \{q_1\} \right] \coprod L_1$$

for all  $1 \leq j \leq d$ . Bearing in mind that

$$\prod_{j=1}^{a} \left\{ \left[ (\beta(D^{(2)}) \cap U_j) \setminus \{p_{1,j}\} \right] \prod L_{1,j} \right\} = \beta^{-1}(\beta(D^{(2)}) \cap \varphi^{-1}(V)),$$

one concludes that  $\varphi$  induces an unramified covering

$$f: \beta^{-1}(\beta(D^{(2)}) \cap \varphi^{-1}(V)) \longrightarrow \operatorname{Bl}^{-1}(\operatorname{Bl}(D^{(1)}) \cap V)$$

of degree d.

(ii) Along the commutative diagram (3), if  $f: D^{(2)} \to D^{(1)}$  is an unramified covering of degree d then by a decreasing induction on  $r \ge i \ge 1$  and making use of (i), one observes that  $\varphi_i: \beta_{i+1} \dots \beta_r(D^{(2)}) \to \operatorname{Bl}_{i+1} \dots \operatorname{Bl}_r(D^{(1)})$  is an unramified covering of degree d, whereas  $\varphi: \rho_2(D^{(2)}) \to \rho_1(D^{(1)})$  is an unramified covering of degree d. Conversely, suppose that  $\varphi: \rho_2(D^{(2)}) \to \rho_1(D^{(1)})$  is an unramified covering of degree d. Then by an increasing induction on  $1 \le i \le r$  and making use of (i), one concludes that

$$\varphi_i: \beta_{i+1} \dots \beta_r(D^{(2)}) \to \operatorname{Bl}_{i+1} \dots \operatorname{Bl}_r(D^{(1)})$$

is an unramified covering of degree d. As a result,  $f: D^{(2)} \to D^{(1)}$  is an unramified covering of degree d.

**Corollary 5.** Let  $X_1 = (\mathbb{B}/\Gamma_1)$  be a smooth toroidal compactification,  $\rho_1 : X_1 \to Y_1$  be a composition of blow downs onto a minimal surface  $Y_1, \varphi : Y_2 \to Y_1$  be an unramified covering of degree d and (4) be the defining commutative diagram of the fibered product  $X_2 = X_1 \times_{Y_1} Y_2$ . Then:

(i) there is a subgroup  $\Gamma_2$  of  $\Gamma_1$  of index  $[\Gamma_1 : \Gamma_2] = d$ , such that  $X_2 = (\mathbb{B}/\Gamma_2)'$  is the toroidal compactification of  $\mathbb{B}/\Gamma_2$ ;

(ii)  $f : X_2 \to X_1$  restricts to unramified coverings  $f : \mathbb{B}/\Gamma_2 \to \mathbb{B}/\Gamma_1$ , respectively,  $f : D^{(2)} := X_2 \setminus (\mathbb{B}/\Gamma_2) \to X_1 \setminus (\mathbb{B}/\Gamma_1) =: D^{(1)}$  of degree d;

(iii) the composition  $\rho_2: X_2 \to Y_2$  of blow downs maps onto a minimal surface  $Y_2$ ;

(iv)  $\varphi$  restricts to an unramified covering  $\varphi: \rho_2(D^{(2)}) \to \rho_1(D^{(1)})$  of degree d.

Proof. By Lemma 3 (ii), the fibered product diagram (4) consists of an unramified covering  $f: X_2 \to X_1$  of degree d and a composition  $\rho_2: X_2 \to Y_2$  of blow downs. The surface  $Y_2$  is minimal. Otherwise any (-1)-curve  $L'_i$  on  $Y_2$  maps isomorphically onto a (-1)-curve  $\varphi(L'_i) \subset Y_1$ , according to Lemma 2 (ii). That contradicts the minimality of  $Y_1$  and shows the minimality of  $Y_2$ .

The unramified covering  $f: X_2 \to X_1 = (\mathbb{B}/\Gamma_1)'$  of degree d restricts to an unramified covering  $f: f^{-1}(\mathbb{B}/\Gamma_1) \to \mathbb{B}/\Gamma_1$  of degree d. The smoothness of  $\mathbb{B}/\Gamma_1$  excludes the existence of isolated branch points of the  $\Gamma_1$ -Galois covering  $\zeta_1: \mathbb{B} \to \mathbb{B}/\Gamma_1$ . However,  $\zeta_1$  can ramify along divisors and  $\mathbb{B}$  is not the usual universal cover of the complex manifold  $\mathbb{B}/\Gamma_1$ . Nevertheless,  $\mathbb{B}$  is the orbifold universal cover of  $\mathbb{B}/\Gamma_1$  and the orbifold universal covering map  $\zeta_1: \mathbb{B} \to \mathbb{B}/\Gamma_1$  factors through a (possibly ramified) covering  $\zeta_2: \mathbb{B} \to f^{-1}(\mathbb{B}/\Gamma_1)$  and the covering  $f: f^{-1}(\mathbb{B}/\Gamma_1) \to \mathbb{B}/\Gamma_1$ , i.e.,  $\zeta_1 = f\zeta_2$ . Since  $\pi_1^{\mathrm{orb}}(\mathbb{B}) = \{1\}$  is a normal subgroup of  $\Gamma_2 := \pi_1^{\mathrm{orb}}(f^{-1}(\mathbb{B}/\Gamma_1))$ , the covering  $\zeta_2$  is Galois and its Galois group  $\Gamma_2$  is a subgroup of  $\Gamma_1 = \pi_1^{\mathrm{orb}}(\mathbb{B}/\Gamma_1)$  of index  $[\Gamma_1:\Gamma_2] = d$ . In particular,  $f^{-1}(\mathbb{B}/\Gamma_1) = \mathbb{B}/\Gamma_2$ . By Lemma 1 (i), f restricts to an unramified covering  $f: D^{(2)} := X_2 \setminus (\mathbb{B}/\Gamma_2) \to X_1 \setminus (\mathbb{B}/\Gamma_1) =: D^{(1)}$  of degree d of the toroidal compactifying divisor  $D^{(1)} = \prod_{j=1}^k D_j^{(1)}$  of  $\mathbb{B}/\Gamma_1$ . Note that for any  $1 \leq j \leq k$  the restriction  $f: f^{-1}(D_j^{(1)}) \to D_j^{(1)}$  is an unramified covering of degree d, whereas a local biholomorphism. Therefore  $f^{-1}(D_j^{(1)}) = \bigcup_{i=1}^{r_j} D_{j,i}^{(2)}$  is smooth and has disjoint smooth irreducible components  $D_{j,i}^{(2)}$ . As a result,

$$D^{(2)} = f^{-1}(D^{(1)}) = \prod_{j=1}^{k} f^{-1}(D_j^{(1)}) = \prod_{j=1}^{k} \prod_{i=1}^{r_j} D_{j,i}^{(2)}$$

has disjoint smooth irreducible components  $D_{j,i}^{(2)}$ . By assumption,  $D_j^{(1)}$  are smooth elliptic curves, so that all  $D_{j,i}^{(2)}$  are smooth elliptic curves by Lemma 2 (i). That is why,  $X_2 = (\mathbb{B}/\Gamma_2)'$ is the toroidal compactification of  $\mathbb{B}/\Gamma_2$ . According to Lemma 4 (ii),  $\varphi: Y_2 \to Y_1$  restricts to an unramified covering  $\varphi: \rho_2(D^{(2)}) \to \rho_1(D^{(1)})$  of degree d.

**Lemma 6.** (i) Let  $f: X_2 \to X_1$  be an unramified covering of degree d of smooth projective surfaces and  $Bl: X_1 \to Y_1$  be a blow down of a (-1)-curve  $L_1 \subset X_1$ . Then the Stein factorization  $\varphi\beta$  of Blf consists of the blow down  $\beta: X_2 \to Y_2$  of  $f^{-1}(L_1) = \prod_{j=1}^d L_{1,j}$  and an unramified covering  $\varphi: Y_2 \to Y_1$  of degree d, so that  $X_2 = X_1 \times_{Y_1} Y_2$  is the fibered product of  $X_1$  and  $Y_2$  over  $Y_1$ .

(ii) Let  $\rho_1 = Bl_1 \dots Bl_r : T_r := X_1 \to Y_1 =: T_0$  be a composition of blow downs of (-1)-curves  $L_i \subset T_i$  and  $f: X_2 \to X_1$  be an unramified covering of degree d. Then the Stein factorization  $\varphi \rho_2$  of  $\rho_1 f: X_2 \to Y_1$  closes the fibered product commutative diagram (4) with the composition  $\rho_2 = \beta_1 \dots \beta_r : S_r := X_2 \to Y_2 := S_0$  of the blow downs  $\beta_i : S_i \to S_{i-1}$  of  $\varphi_i^{-1}(L_i) = \prod_{j=1}^d L_{i,j}$  for all  $1 \leq i \leq r$  and an unramified covering  $\varphi : Y_2 \to Y_1$  of degree d.

*Proof.* (i) If Bl $f = \varphi \beta$  :  $X_2 \to Y_1$  is the Stein factorization of Blf and  $q_1 := Bl(L_1)$ 

then  $(\mathrm{Bl}f)^{-1}(q_1) = f^{-1}\mathrm{Bl}^{-1}(q_1) = f^{-1}(L_1) = \prod_{j=1}^d L_{1,j}$  has irreducible components  $L_{1,j}$ by Lemma ??. For any  $q \in Y_1 \setminus \{q_1\}$  one has  $(\mathrm{Bl}f)^{-1}(q) = f^{-1}\mathrm{Bl}^{-1}(q) = f^{-1}(q)$  of cardinality  $|f^{-1}(q)| = d$ . Therefore, the surjective morphism  $\beta : X_2 \to Y_2$  with connected fibres is the blow down of  $L_{1,j}$ ,  $\forall 1 \leq j \leq d$ . According to Lemma 1 (i), the restriction  $f : X_2 \setminus f^{-1}(L_1) \to X_1 \setminus L_1$  is an unramified covering of degree d, since  $f : f^{-1}(L_1) \to L_1$ is an unramified covering of degree d. In such a way, there arises a commutative diagram

$$\begin{array}{cccc} X_2 \setminus f^{-1}(L_1) & \xrightarrow{\beta = \mathrm{Id}} & Y_2 \setminus \beta f^{-1}(L_1) \\ & & & & & \\ f & & & & \varphi \\ & & & & & \\ X_1 \setminus L_1 & \xrightarrow{\mathrm{Bl} = \mathrm{Id}} & & & Y_1 \setminus \{q_1\} \end{array}$$

and  $\varphi: Y_2 \setminus \beta f^{-1}(L_1) \to Y_1 \setminus \{q_1\}$  is an unramified covering of degree d. If  $p_{1,j} := \beta(L_{1,j})$  then  $\beta^{-1} \varphi^{-1}(q_1) = (\varphi\beta)^{-1}(q_1) = (\operatorname{Bl} f)^{-1}(q_1) = \prod_{j=1}^d L_{1,j}$  reveals that  $\varphi^{-1}(q_1) = \{p_{1,j} \mid 1 \leq j \leq d\}$  consists of d points and  $\varphi: Y_2 \to Y_1$  is an unramified covering of degree d. By Lemma 3 (i), the fibered product  $X'_2 := X_1 \times_{Y_1} Y_2$  is the blow up of  $Y_2$  at  $\varphi^{-1}(q_1) = \{p_{1,j} \mid 1 \leq j \leq d\}$ , so that  $X'_2 = X_2$ .

According to Grothendieck's Corollary 17.7.3 (i) from [Groth4], it suffices to show that  $X'_2 = X_2$ , in order to conclude that  $\varphi : Y_2 \to Y_1$  is an unramified covering of degree d. We have justified straightforwardly that  $\varphi : Y_2 \to Y_1$  is an unramified covering of degree d, in order to use it towards the coincidence of  $X_2$  with the fibered product  $X'_2 := X_1 \times_{Y_1} Y_2$ .

(ii) is an immediate consequence of the fact that the composition of morphisms with connected fibres has connected fibres.

**Corollary 7.** Let  $f: X_2 \to X_1 = (\mathbb{B}/\Gamma_1)'$  be an unramified covering of degree d of a smooth toroidal compactification  $X_1 = (\mathbb{B}/\Gamma_1)'$ ,  $\rho_1: X_1 \to Y_1$  be a composition of blow downs onto a minimal surface  $Y_1$  and  $D^{(1)} := X_1 \setminus (\mathbb{B}/\Gamma_1)$  be the toroidal compactifying divisor of  $\mathbb{B}/\Gamma_1$ . Then:

(i) there exist a composition  $\rho_2 : X_2 \to Y_2$  of blow downs onto a minimal surface  $Y_2$  and an unramified covering  $\varphi : Y_2 \to Y_1$  of degree d, which exhibits  $X_2 = X_1 \times_{Y_1} Y_2$  as a fibered product of  $X_1$  and  $Y_2$  over  $Y_1$ ;

(ii) there is a subgroup  $\Gamma_2 < \Gamma_1$  of index  $[\Gamma_1 : \Gamma_2] = d$ , such that  $X_2 = (\mathbb{B}/\Gamma_2)'$  is the toroidal compactification of  $\mathbb{B}/\Gamma_2$  and f restricts to unramified coverings  $f : \mathbb{B}/\Gamma_2 \to \mathbb{B}/\Gamma_1$ ,  $f : D^{(2)} := X_2 \setminus (\mathbb{B}/\Gamma_2) \to X_1 \setminus (\mathbb{B}/\Gamma_2) =: D^{(1)}$  of degree d;

(iii)  $\varphi$  restricts to an unramified covering  $\varphi: \rho_2(D^{(2)}) \to \rho_1(D^{(1)})$  of degree d.

*Proof.* (i) is an immediate consequence of Lemma 6 (ii) and the fact that any inramified cover  $Y_2$  of a minimal surface  $Y_1$  is minimal.

(ii) The unramified covering  $f: X_2 \to X_1 = (\mathbb{B}/\Gamma_1)'$  of degree d restricts to an unramified covering  $f: f^{-1}(\mathbb{B}/\Gamma_1) \to \mathbb{B}/\Gamma_1$  of degree d. As in the proof of Corollary 5, there is a subgroup  $\Gamma_2 < \Gamma_1$  of index  $[\Gamma_1 : \Gamma_2] = d$ , such that  $X_2 = (\mathbb{B}/\Gamma_2)'$  is the

toroidal compactification of  $\mathbb{B}/\Gamma_2$  and f restricts to unramified coverings  $f: \mathbb{B}/\Gamma_2 \to \mathbb{B}/\Gamma_1$ ,  $f: D^{(2)} := X_2 \setminus (\mathbb{B}/\Gamma_2) \to X_1 \setminus (\mathbb{B}/\Gamma_1) =: D^{(1)}$  of degree d.

(iii) is an immediate consequence of Lemma 4 (ii).

**Definition 8.** A smooth toroidal compactification  $X_1 = (\mathbb{B}/\Gamma_1)'$  is saturated if there is no unramified covering  $f: X_2 = (\mathbb{B}/\Gamma_2)' \to (\mathbb{B}/\Gamma_1)' = X_1$  of degree d, which restricts to an unramified covering  $f: \mathbb{B}/\Gamma_2 \to \mathbb{B}/\Gamma_1$  of degree d.

Bearing in mind that the fundamental group of a smooth projective variety is a birational invariant, one combines Corollary 5 with Corollary 7 and obtains the following

**Corollary 9.** A smooth toroidal compactification  $X_1 = (\mathbb{B}/\Gamma_1)'$  is saturated if and only if one and, therefore, any minimal model  $Y_1$  of  $X_1$  is simply connected.

#### 2 Unramified push forward of a smooth compactification

Let  $X_2$  be a smooth projective surface,  $\beta : X_2 \to Y_2$  be a blow down with exceptional divisor  $E(\beta) = \prod_{s=1}^{d} L_{1,s}$  and  $f : X_2 \to X_1$  be an unramified covering of degree d, which restricts to an unramified covering  $f : E(\beta) \to f(E(\beta))$  of degree d. According to Lemma 2 (ii),  $L_1 := f(E(\beta))$  is a (-1)-curve on  $X_1$ . Then Lemma 6 (i) implies that there is a fibered product commutative diagram (1) with the blow down  $\operatorname{Bl} : X_1 \to Y_1$  of  $L_1$  and an unramified covering  $\varphi : Y_2 \to Y_1$  of degree d, which shrinks  $\beta(E(\beta)) = \{p_{1,j} := \beta(L_{1,j}) \mid 1 \leq j \leq d\}$  to a point  $q_1 \in Y_1$ . We say that  $\varphi$  is induced by f.

Suppose that  $\rho_2 = \beta_1 \dots \beta_r : S_r := X_2 \to Y_2 =: S_0$  is a composition of blow downs

$$\beta_i : S_i := \beta_{i+1} \dots \beta_r(S_r) \longrightarrow S_{i-1} := \beta_i \dots \beta_r(S_r)$$
(5)

with exceptional divisors  $E(\beta_i) = \prod_{s=1}^d L_{i,s}$  for all  $1 \le i \le r$ . By a decreasing induction on  $r \ge i \ge 1$ , let us assume that there is a fibered product commutative diagram

$$S_{r} \xrightarrow{\beta_{r}} S_{r-1} \qquad \dots S_{i+1} \xrightarrow{\beta_{i+1}} S_{i}$$

$$f = \varphi_{r} \downarrow \qquad \varphi_{r-1} \downarrow \qquad \varphi_{i+1} \downarrow \qquad \varphi_{i} \downarrow$$

$$f(S_{r}) \xrightarrow{\operatorname{Bl}_{r}} \varphi_{r-1}(S_{r-1}) \qquad \dots \varphi_{i+1}(S_{i+1}) \xrightarrow{\operatorname{Bl}_{i+1}} \varphi_{i}(S_{i})$$

with fibered product squares  $\operatorname{Bl}_{j}\varphi_{j} = \varphi_{j-1}\beta_{j}$ , such that  $\varphi_{j}$  restricts to an unramified covering  $\varphi_{j} : E(\beta_{j}) \to L_{j} := \varphi_{j}(E(\beta_{j}))$  of degree d and  $\varphi_{j-1}$  shrinks the set  $\beta_{j}(E(\beta_{j})) = \{p_{j,s} := \beta_{j}(L_{j,s}) \mid 1 \leq s \leq d\}$  to a point  $q_{j} \in \varphi_{j-1}(S_{j-1})$  for all  $r \geq j \geq i+1$ . If  $\varphi_{i} : S_{i} \to \varphi_{i}(S_{i})$  restricts to an unramified covering  $\varphi_{i} : E(\beta_{i}) \to L_{i} := \varphi_{i}(E(\beta_{i}))$  of degree d then there is an unramified covering  $\varphi_{i-1} : S_{i-1} \to \varphi_{i-1}(S_{i-1})$  of degree d, which shrinks  $\beta_{i}(E_{\beta_{i}}) = \{p_{i,s} = \beta_{i}(L_{i,s}) \mid 1 \leq s \leq d\}$  to a point  $q_{i} \in S_{i-1}$  and closes the fibered product commutative diagram  $\varphi_{i-1}\beta_{i} = \operatorname{Bl}_{i}\varphi_{i}$ . Thus, if an unramified covering  $f : X_{2} \to X_{1}$ 

of degree d induces unramified coverings  $E(\beta_i) = \prod_{s=1}^d L_{i,s} \to L_i$  of degree d for all  $1 \le i \le r$ then there is an unramified covering  $\varphi := \varphi_0 : Y_2 = S_0 \to \varphi_0(S_0) =: Y_1$  of degree d, which induces unramified coverings  $\beta_i(E(\beta_i)) = \{p_{i,s} := \beta_i(L_{i,s}) \mid 1 \le s \le d\} \to \{q_i\} \subset \varphi_{i-1}(S_{i-1})$ of degree d for all  $1 \le i \le r$ .

Conversely, assume that  $Y_2$  is a smooth projective surface,  $\beta : X_2 \to Y_2$  is a blow down with exceptional divisor  $E(\beta) = \prod_{s=1}^d L_{1,s}$  and  $\varphi : Y_2 \to Y_1$  is an unramified covering of degree d, which shrinks  $\beta(E(\beta)) = \{p_{1,s} = \beta(L_{1,s}) \mid 1 \le s \le d\}$  to a point  $q_1 \in Y_1$ . According to Lemma 3 (i), there is a fibered product commutative diagram (1), where Bl :  $X_1 \to Y_1$  is the blow up of  $Y_1$  at  $q_1 \in Y_1$  and  $f : X_2 \to X_1$  is an unramified covering of degree d, which restricts to an unramified covering  $f : E(\beta) = \prod_{s=1}^d L_{1,s} \to L_1 := \text{Bl}^{-1}(q_1)$  of degree d. Let  $\rho_2 = \beta_1 \dots \beta_r : S_r := X_2 \to Y_2 =: S_0$  be a composition of blow downs (5) with exceptional divisors  $E(\beta_i) = \prod_{s=1}^d L_{i,s}$ . By an increasing induction on  $1 \le i \le r$ , suppose that

$$S_{i} \xrightarrow{\beta_{i}} S_{i-1} \qquad \dots S_{1} \xrightarrow{\beta_{1}} S_{0} = Y_{2}$$

$$\varphi_{i} \downarrow \qquad \varphi_{i-1} \downarrow \qquad \varphi_{1} \downarrow \qquad \varphi_{2} = \varphi_{0} \downarrow$$

$$\varphi_{i}(S_{i}) \xrightarrow{\operatorname{Bl}_{i}} \varphi_{i-1}(S_{i-1}) \qquad \dots \varphi_{1}(S_{1}) \xrightarrow{\operatorname{Bl}_{1}} \varphi(Y_{2})$$

is a fibered product commutative diagram with fibered product squares  $\varphi_{j-1}\beta_j = Bl_j\varphi_j$ , such that  $\varphi_{j-1}$  restricts to an unramified covering

$$\varphi_{j-1}:\beta_j(E(\beta_j))=\{p_{j,s}:=\beta_j(L_{j,s})\mid 1\le s\le d\}\longrightarrow \{q_j\}\subset \varphi_{j-1}(S_{j-1})$$

of degree d and  $\varphi_i$  restricts to an unramified covering

$$\varphi_j : E(\beta_j) = \prod_{s=1}^d L_{j,s} \longrightarrow \varphi_j(E(\beta_j)) =: L_j$$

of degree d for all  $1 \leq j \leq i$ . If  $\varphi_i$  restricts to an unramified covering

$$\varphi_i : \beta_{i+1}(E(\beta_{i+1})) = \{ p_{i+1,s} = \beta_{i+1}(L_{i+1,s}) \mid 1 \le s \le d \} \longrightarrow \{ q_{i+1} \} \subset \varphi_i(S_i)$$

of degree d then there is an unramified covering

$$\varphi_{i+1}: S_{i+1} \longrightarrow \varphi_{i+1}(S_{i+1})$$

of degree d, which restricts to an unramified covering

$$\varphi_{i+1}: E(\beta_{i+1}) = \prod_{s=1}^d L_{i+1,s} \longrightarrow L_{i+1} := \varphi_{i+1}(E(\beta_{i+1}))$$

of degree d and closes the fibered product commutative diagram  $\varphi_i\beta_{i+1} = Bl_{i+1}\varphi_{i+1}$  with the blow down  $Bl_{i+1} : \varphi_{i+1}(S_{i+1}) \to \varphi_i(S_i)$  of  $L_{i+1}$ . In such a way, if  $\varphi : Y_2 \to Y_1$  is an unramified covering of degree d, which induces unramified coverings

$$\beta_i(E(\beta_i)) = \{p_{i,s} := \beta_i(L_{i,s}) \mid 1 \le s \le d\} \longrightarrow \{q_i\} \subset \varphi_{i-1}(S_{i-1})$$

of degree d for all  $1 \leq i \leq r$  then  $f := \varphi_r : X_2 \to f(X_2)$  is an unramified covering of degree d, which induces unramified coverings  $E(\beta_i) = \coprod_{s=1}^d L_{i,s} \to L_i$  of degree d for all  $1 \leq i \leq r$ . The above considerations justify the following

**Lemma-Definition 10.** Let  $X_2$ ,  $Y_2$  be smooth projective surfaces and

$$\rho_2 = \beta_1 \dots \beta_r : S_r := X_2 \longrightarrow Y_2 =: S_0$$

be a composition of blow downs (5) with exceptional divisors  $E(\beta_i)$  for all  $1 \le i \le r$ . Then the following are equivalent:

(i) there is an unramified covering  $f: X_2 \to f(X_2)$  of degree d, which induces unramified coverings  $E(\beta_i) = \coprod_{s=1}^d L_{i,s} \to L_i$  of degree d for all  $1 \le i \le r$ ;

(ii) there is an unramified covering  $\varphi: Y_2 \to \varphi(Y_2)$  of degree d, which induces unramified coverings  $\beta_i(E(\beta_i)) = \{p_{i,s} = \beta_i(L_{i,s}) \mid 1 \le s \le d\} \to \{q_i\} \subset \varphi_{i-1}(S_{i-1})$  of degree d for all  $1 \le i \le r$ .

If there holds one and, therefore, any one of the aforementioned conditions then there is a fibered product commutative diagram (4), where

$$\rho_1 = \operatorname{Bl}_1 \dots \operatorname{Bl}_r : X_1 := \varphi(X_2) \to \varphi(Y_2) =: Y_1$$

is the composition of blow downs  $Bl_i$  of  $L_i$  for all  $1 \le i \le r$  and we say that  $f: X_2 \to f(X_2)$ and  $\varphi: Y_2 \to \varphi(Y_2)$  are compatible with  $\rho$ .

**Corollary 11.** Let  $X_2 = (\mathbb{B}/\Gamma_2)'$  be a smooth toroidal compactification and  $\rho_2 : X_2 \to Y_2$  be a composition of blow downs onto a minimal surface  $Y_2$ . If there is an unramified covering  $f : X_2 = (\mathbb{B}/\Gamma_2)' \to f(X_2) =: X_1$  of degree d, which is compatible with  $\rho_2$  and restricts to an unramified covering  $f : \mathbb{B}/\Gamma_2 \to f(\mathbb{B}/\Gamma_2)$  of degree d then:

(i) there is a fibered product commutative diagram (4) with an unramified covering  $\varphi$ :  $Y_2 \to \varphi(Y_2) =: Y_1$  of degree d and a composition of blow downs  $\rho_1 : X_1 \to Y_1$  onto a minimal surface  $Y_1$ ;

(ii) there is a lattice  $\Gamma_1$  of  $\operatorname{Aut}(\mathbb{B}) = PU(2,1)$ , containing  $\Gamma_2$  as a subgroup of index  $[\Gamma_1:\Gamma_2] = d$  and such that  $X_1 = (\mathbb{B}/\Gamma_1)'$  is the toroidal compactification of  $\mathbb{B}/\Gamma_1$ ;

(iii)  $\varphi$  restricts to an unramified covering  $\varphi : \rho_2(D^{(2)}) \to \rho_1(D^{(1)})$  of degree d, where  $D^{(j)} := X_j \setminus (\mathbb{B}/\Gamma_j)$  are the compactifying divisors of  $\mathbb{B}/\Gamma_j$ ,  $1 \le j \le 2$ .

*Proof.* (i) is an immediate consequence of Lemma 10.

Towards (ii), let us note that the composition  $f\zeta_2 : \mathbb{B} \to f(\mathbb{B}/\Gamma_2)$  of the orbifold universal covering  $\zeta_2 : \mathbb{B} \to \mathbb{B}/\Gamma_2$  with the unramified covering  $f : \mathbb{B}/\Gamma_2 \to f(\mathbb{B}/\Gamma_2)$  is Galois, since  $\pi_1^{\text{orb}}(\mathbb{B}) = \{1\}$  is a normal subgroup of  $\Gamma_1 := \pi_1^{\text{orb}}(f(\mathbb{B}/\Gamma_2))$ . Moreover,  $\pi_1^{\text{orb}}(\mathbb{B}/\Gamma_2) = \Gamma_2$  is a subgroup of  $\Gamma_1$  of index  $[\Gamma_1 : \Gamma_2] = d$  and  $f(\mathbb{B}/\Gamma_2) = \mathbb{B}/\Gamma_1$ . By Lemma 1 (i),  $f : X_2 \to X_1$ 

restricts to an unramified covering  $f: D^{(2)} = X_2 \setminus (\mathbb{B}/\Gamma_2) \to D^{(1)} := X_1 \setminus (\mathbb{B}/\Gamma_1)$  of degree d. The toroidal compactifying divisor  $D^{(2)}$  of  $\mathbb{B}/\Gamma_2$  has disjoint smooth elliptic irreducible components, so that Lemma 2 (i) applies to provide that  $D^{(1)}$  consists of disjoint smooth elliptic irreducible components and  $X_1 = (\mathbb{B}/\Gamma_1)'$  is the toroidal compactification of  $\mathbb{B}/\Gamma_1$ . According to Lemma 4 (ii), that suffices for  $\varphi: Y_2 \to Y_1$  to restrict to an unramified covering  $\varphi: \rho_2(D^{(2)}) \to \rho_1(D^{(1)})$ .

**Corollary 12.** Let  $X_2 = (\mathbb{B}/\Gamma_2)'$  be a smooth toroidal compactification,  $D^{(2)} := X_2 \setminus (\mathbb{B}/\Gamma_2)$ be the compactifying divisor of  $\mathbb{B}/\Gamma_2$  and  $\rho_2 : X_2 \to Y_2$  be a composition of blow downs onto a minimal surface  $Y_2$ . If  $\varphi : Y_2 \to \varphi(Y_2)$  is an unramified covering of degree d, which is compatible with  $\rho_2$  and restricts to an unramified covering  $\varphi : \rho_2(D^{(2)}) \to \varphi \rho_2(D^{(2)})$  of degree d then:

(i) there is a fibered product commutative diagram (4) with an unramified covering f:  $X_2 \rightarrow f(X_2) =: X_1$  of degree d and a composition of blow downs  $\rho_1 : X_1 \rightarrow Y_1$  onto a minimal surface  $Y_1$ ;

(ii) there is a lattice  $\Gamma_1$  of  $\operatorname{Aut}(\mathbb{B}) = PU(2,1)$ , containing  $\Gamma_2$  as a subgroup of index  $[\Gamma_1:\Gamma_2] = d$  and such that  $X_1 = (\mathbb{B}/\Gamma_1)'$  is the toroidal compactification of  $\mathbb{B}/\Gamma_1$ ;

(iii) f restricts to an unramified covering  $f : \mathbb{B}/\Gamma_2 \to \mathbb{B}/\Gamma_1$  of degree d.

Proof. Lemma 10 justifies (i). According to Lemma 4 (ii), f restricts to an unramified covering  $f: D^{(2)} \to f(D^{(2)})$  of degree d. Then Lemma 1 (i) applies to provide that  $f: X_2 \setminus D^{(2)} = \mathbb{B}/\Gamma_2 \to X_1 \setminus f(D^{(2)})$  is an unramified covering of degree d. The proof of Corollary 11 (ii) has established that this is sufficient for the existence of a lattice  $\Gamma_1$  of Aut( $\mathbb{B}$ ) = PU(2, 1), containing  $\Gamma_2$  as a subgroup of index [ $\Gamma_1 : \Gamma_2$ ] = d and such that  $X_1 \setminus f(D^{(2)}) = \mathbb{B}/\Gamma_1$ . That justifies (iii). By assumption,  $D^{(2)}$  consists of smooth elliptic irreducible components. Therefore  $f(D^{(2)})$  has smooth elliptic irreducible components and  $X_1 = (\mathbb{B}/\Gamma_1) \coprod f(D^{(2)})$  is the toroidal compactification of  $\mathbb{B}/\Gamma_1$ .

**Definition 13.** Let  $X = (\mathbb{B}/\Gamma)'$  be a smooth toroidal compactification. If there is no unramified covering  $f : X \to f(X)$  of degree d, which restricts to an unramified covering  $f : \mathbb{B}/\Gamma \to f(\mathbb{B}/\Gamma)$  of degree d and is compatible with some composition of blow downs  $\rho: X \to Y$  onto a minimal surface Y, we say that  $X = (\mathbb{B}/\Gamma)'$  is primitive.

The Euler characteristic of a smooth toroidal compactification  $X = (\mathbb{B}/\Gamma)'$  is a natural number  $e(X) = e(\mathbb{B}/\Gamma)$ . That is why, there exists a primitive smooth toroidal compactification  $X_0 = \overline{\mathbb{B}}/\Gamma_0$  and a finite sequence

$$X_n := X \xrightarrow{f_n} X_{n-1} \qquad \dots X_i \xrightarrow{f_i} X_{i-1} \dots \qquad X_1 \xrightarrow{f_1} X_0$$

of unramified coverings  $f_i : X_i = (\mathbb{B}/\Gamma_i)' \to (\mathbb{B}/\Gamma_{i-1})' = X_{i-1}$  of degree  $d_i$  of smooth toroidal compactifications  $X_j = (\mathbb{B}/\Gamma_j)'$ , which restrict to unramified coverings  $f_i : \mathbb{B}/\Gamma_i \to \mathbb{B}/\Gamma_{i-1}$ of degree  $d_i$  and are compatible with some compositions of blow downs  $\rho_i : X_i \to Y_i$  onto minimal surfaces  $Y_i$ . Combining Corollary 11 with Corollary 12, one obtains the following **Corollary 14.** Let  $X = (\mathbb{B}/\Gamma)'$  be a smooth toroidal compactification with toroidal compactifying divisor  $D := X \setminus (\mathbb{B}/\Gamma)$ . Then X is primitive if and only if no one minimal model Y of X with a composition of blow downs  $\rho : X \to Y$  admits an unramified covering  $\varphi : Y \to \varphi(Y)$  of degree d > 1, which restricts to an unramified covering  $\varphi : \rho(D) \to \varphi\rho(D)$ of degree d and is compatible with  $\rho$ .

Let us suppose that a smooth toroidal compactification  $X = (\mathbb{B}/\Gamma)'$  with toroidal compactifying divisor  $D := X \setminus (\mathbb{B}/\Gamma)$  admits a blow down  $\beta : X \to Y$  of  $n \in \mathbb{N}$  smooth irreducible rational (-1)-curves onto a minimal surface Y and there is an unramified covering  $\varphi : Y \to \varphi(Y)$  of degree d, which restricts to unramified coverings  $\varphi : \beta(D) \to \varphi\beta(D)$  and  $\varphi : \beta(E(\beta)) \to \varphi\beta(E(\beta))$  of degree d. Then the Euler number of the smooth surface  $\varphi(Y)$ is  $e(\varphi(Y)) = \frac{e(Y)}{d} \in \mathbb{Z}$  and the cardinality of  $\varphi\beta(E(\beta))$  if  $|\varphi\beta(E(\beta))| = \frac{|\beta(E(\beta))|}{d} = \frac{n}{d} \in \mathbb{N}$ , so that  $d \in \mathbb{N}$  divides e(Y) and  $n = |\beta(E(\beta))|$ . As a result, d divides the greatest common divisor  $\operatorname{GCD}(|\beta(E(\beta))|, e(Y))$ .

Note that the compatibility of an unramified covering  $\varphi: Y \to \varphi(Y)$  with  $\beta: X \to Y$ reduces to  $\varphi^{-1}(\varphi\beta(E(\beta)) = \beta(E(\beta))$  and is detected on Y. When  $\rho = \beta_1 \dots \beta_r : X \to Y$ is a composition of  $r \geq 2$  blow downs, the compatibility of an unramified covering  $\varphi$ :  $Y \to \varphi(Y)$  of degree d with  $\rho$  cannot be traced out on the minimal model Y of X alone. Namely, if  $S_0 := Y, T_0 := \varphi(Y)$  then in the notations from the commutative diagram (3), the unramified covering  $\varphi_1 : S_1 \to T_1$  of degree d may restrict to an unramified covering  $\varphi_1 : \beta_2(E(\beta_2)) \to \varphi_1\beta_2(E(\beta_2))$  of degree d, but  $\varphi_0 := \varphi$  is not supposed to restrict to an unramified covering  $\varphi: \beta_1\beta_2(E(\beta_2)) \to \varphi\beta_1\beta_2(E(\beta_2))$  of degree d. More precisely, if an irreducible component  $L_{1,j}$  of  $E(\beta_1)$  intersects  $\beta_2(E(\beta_2))$  in at least two points then  $|\beta_1\beta_2(E(\beta_2))| < d$  and  $\varphi: \beta_1\beta_2(E(\beta_2)) \to \varphi\beta_1\beta_2(E(\beta_2))$  is of degree < d.

## 3 Saturated and primitive smooth compactifications of nonpositive Kodaira dimension

**Definition 15.** Let  $X = (\mathbb{B}/\Gamma)'$  and  $X_0 = (\mathbb{B}/\Gamma_0)'$  be smooth toroidal compactification. We say that X dominates  $X_0$  and write  $X \succeq X_0$  or  $X_0 \preceq X$  if there exist a finite sequence of ball lattices

$$\Gamma_n := \Gamma < \Gamma_{n-1} < \ldots < \Gamma_i < \Gamma_{i-1} < \ldots < \Gamma_1 < \Gamma_0$$

with smooth toroidal compactifications  $X_i = (\mathbb{B}/\Gamma_i)'$  of the corresponding ball quotients  $\mathbb{B}/\Gamma_i$ and a finite sequence of unramified coverings

$$X_n := X \xrightarrow{f_n} X_{n-1} \qquad \dots X_i \xrightarrow{f_i} X_{i-1} \dots \qquad X_1 \xrightarrow{f_1} X_0$$

of degree deg  $[f_i : X_i \to X_{i-1}] = [\Gamma_{i-1} : \Gamma_i] = d_i \in \mathbb{N}$ , which restrict to unramified coverings  $f_i : \mathbb{B}/\Gamma_i \to \mathbb{B}/\Gamma_{i-1}$  of degree  $d_i$  and are compatible with some compositions  $\rho_i = \beta_{i,1} \dots \beta_{i,r_i} : X_i \to Y_i$  of blow downs  $\beta_{i,j}$  onto minimal surfaces  $Y_i$ .

It is clear that a smooth toroidal compactification  $X = \overline{\mathbb{B}/\Gamma}$  is saturated if and only if it is maximal with respect to the partial order  $\succeq$ . Similarly, X is primitive exactly when it is minimal with respect to  $\succeq$ . Note that the partial order  $\succeq$  on the set S of the smooth toroidal compactifications  $X = (\mathbb{B}/\Gamma)'$  is artinian, i.e., any subset  $S_o \subseteq S$  has a minimal element  $X_o = (\mathbb{B}/\Gamma_o)' \in \mathcal{S}_o$ . The minimal  $X \in \mathcal{S}$  are exactly the primitive ones, but the minimal  $X_o \in \mathcal{S}_o$  are not necessarily primitive, since such  $X_o$  is not supposed to be a minimal element of  $\mathcal{S}$ .

The present section discusses the saturated and the primitive smooth toroidal compactifications  $X = (\mathbb{B}/\Gamma)'$  of Kodaira dimension  $\kappa(X) \leq 0$ .

**Proposition 16.** If  $X = (\mathbb{B}/\Gamma)'$  is a smooth toroidal compactification of Kodaira dimension  $\kappa(X) = -\infty$  then X is a rational surface or X has a ruled minimal model  $\pi: Y \to E$  with an elliptic base E.

Any smooth rational  $X = (\mathbb{B}/\Gamma)'$  is both saturated and primitive.

There is no smooth saturated  $X = (\mathbb{B}/\Gamma)'$ , whose minimal model is a ruled surface  $\pi: Y \to E$  with an elliptic base E.

Proof. (i) Let  $\rho: X = (\mathbb{B}/\Gamma)' \to Y$  be a composition of blow downs onto a minimal surface Y of  $\kappa(Y) = -\infty$ , Then  $Y = \mathbb{P}^2(\mathbb{C})$  is the complex projective plane or  $\pi: Y \to E$  is a ruled surface with a base E of genus  $g \in \mathbb{Z}^{\geq 0}$ . The toroidal compactifying divisor  $D := X \setminus (\mathbb{B}/\Gamma) = \prod_{j=1}^{k} D_j$  has disjoint smooth irreducible elliptic components  $D_j$ . If  $g \geq 2$  then the morphisms  $\pi\rho: D_j \to E$  map to points  $p_j := \pi\rho(D_j) \in E$ , so that  $\rho(D_j) \subseteq \pi^{-1}(p_j)$  for all  $1 \leq j \leq k$ . The exceptional divisor L of  $\rho: X \to Y$  has finite image  $\rho(L) = \{q_1, \ldots, q_m\}$  on Y and  $\rho(L) \subseteq \prod_{i=1}^{m} \pi^{-1}(\pi(q_i))$ . Therefore

$$Y' := Y \setminus \left[ \prod_{i=1}^{m} \pi^{-1}(\pi(q_i)) \right] \subseteq Y \setminus \rho(L) \equiv X \setminus L$$

and  $\rho$  acts identically on Y'. Moreover,

$$Y'' := Y' \setminus \left[ \prod_{j=1}^k \pi^{-1}(p_j) \right] = Y \setminus \left[ \left( \prod_{i=1}^m \pi^{-1}(\pi(q_i)) \right) \coprod \left( \prod_{j=1}^k \pi^{-1}(p_j) \right) \right] \subseteq \mathbb{B}/\Gamma.$$

However, Y'' contains (infinitely many) fibres  $\pi^{-1}(e) \simeq \mathbb{P}^1(\mathbb{C}), e \in E$  of  $\pi : Y \to E$  and that contradicts the Kobayashi hyperbolicity of  $\mathbb{B}/\Gamma$ . In such a way, we have shown that any minimal model Y of a smooth toroidal compactification  $X = (\mathbb{B}/\Gamma)'$  of  $\kappa(X) = -\infty$  is birational to  $\mathbb{P}^2(\mathbb{C})$  or to a minimal ruled surface  $\pi : Y \to E$  with an elliptic base E.

Any rational  $X = (\mathbb{B}/\Gamma)'$  is simply connected and does not admit finite unramified coverings  $X_1 \to X$  of degree d > 1. That is why X is saturated. Let us suppose that f : $X = (\mathbb{B}/\Gamma)' \to X_0 = (\mathbb{B}/\Gamma_0)'$  is an unramified covering of degree d > 1, which is compatible with some composition of blow downs  $\rho : X \to Y$  onto a minimal rational surface Y and restricts to an unramified covering  $f : \mathbb{B}/\Gamma \to \mathbb{B}/\Gamma_0$  of degree d. The Kodaira dimension is preserved under finite unramified coverings, so that  $\kappa(X_0) = \kappa(X) = -\infty$ . The surface  $X_0$  is not simply connected, whereas non-rational. Therefore, there is a composition  $\rho_0 : X_0 \to Y_0$ of blow downs onto a ruled surface  $\pi_0 : Y_0 \to E_0$  with base  $E_0$  of genus  $g_0 \in \mathbb{N}$ . The surjective morphism  $\rho_0 f : X = (\mathbb{B}/\Gamma)' \to Y_0$  induces an embedding  $(\rho_0 f)^* : H^{0,1}(Y_0) \to H^{0,1}(X)$ . On one hand, the irregularity of  $Y_0$  is  $h^{0,1}(Y_0) := \dim_{\mathbb{C}} H^{0,1}(Y_0) = g_o \in \mathbb{N}$ . On the other hand, the rational surface X has vanishing irregularity  $h^{0,1}(X) = 0$ . That contradicts the presence of a finite unramified covering  $f: X \to X_0$  of degree d > 1 and shows that any smooth rational toroidal compactification  $X = (\mathbb{B}/\Gamma)'$  is primite.

Let  $X = (\mathbb{B}/\Gamma)'$  be a smooth toroidal compactification, whose minimal model Y is a ruled surface  $\pi : Y \to E$  with an elliptic base E. Since Y is birational to  $\mathbb{P}^1(\mathbb{C}) \times E$  and the fundamental group is a birational invariant, one has  $\pi_1(X) \simeq \pi_1(Y) \simeq \pi_1(E) \simeq (\mathbb{Z}^2, +)$ . In particular, Y is not simply connected. According to Corollary 9, X cannot be saturated.

According to the Enriques-Kodaira classification, there are four types of minimal smooth projective surfaces Y of Kodaira dimension  $\kappa(Y) = 0$ . These are the abelian and the bielliptic surfaces with universal cover  $\mathbb{C}^2$ , as well as the K3 and the Enriques surfaces with K3 universal cover. If  $\varphi: Y_2 \to Y_1$  is a finite unramified covering of smooth projective surfaces then the Kodaira dimension  $\kappa(Y_1) = \kappa(Y_2)$  and the universal covers  $Y_1 = Y_2$  coincide. Let  $Y_2$  be a smooth projective surface with a fixed point free involution  $g_o: Y_2 \to Y_2$  and  $\beta: X_2 \to Y_2$  be the blow up of  $Y_2$  at a  $\langle g_o \rangle$ -orbit  $\{p_{1,1}, p_{1,2} = g_o(p_{1,1})\} \subset Y_2$ . Then by the very definition of a blow up,  $g_o$  induces a fixed point free involution  $g_1: X_2 \to X_2$ , which leaves invariant the exceptional divisor  $E(\beta) = L_{1,1} \coprod L_{1,2}, L_{1,i} := \beta^{-1}(p_{1,i})$  of  $\beta$  and there is a fibered product commutative diagram (4) with a  $\langle g_o \rangle$ -Galois covering  $\varphi: Y_2 \to Y_1$ , a  $\langle g_1 \rangle$ -Galois covering  $f: X_2 \to X_1$  and the blow up  $Bl: X_1 \to Y_1$  of  $Y_1$  at  $\{q_1\} = \varphi(\{p_{1,1}, p_{1,2}\})$ . Now, suppose that  $\rho_2 = \beta_1 \dots \beta_r : S_r := X_2 \to Y_2 =: S_0$  is a composition of blow downs with exceptional divisors  $E(\beta_i) = L_{i,1} \coprod L_{i,2}$  and  $g_o: S_0 \to S_0$  is a fixed point free involution. By an increasing induction on  $1 \leq i \leq r$ , if  $g_{i-1}: S_{i-1} \to S_{i-1}$  is a fixed point free involution, which leaves invariant  $\beta_i(E(\beta_i)) = \{p_{i,1}, p_{i,2}\}$  then there is a fixed point free involution  $g_i: S_i \to S_i$ , which leaves invariant  $E(\beta_i) = L_{i,1} \coprod L_{i,2}$ . In such a way, if a fixed point free involution  $g_0: S_0 \to S_0$  induces isomorphisms  $L_{i,1} \to L_{i,2}$  for all  $1 \le i \le r$  then there is a fixed point free involution  $g_r: S_r \to S_r$  and a fibered product commutative diagram (4) with a  $\langle g_o \rangle$ -Galois covering  $\varphi: Y_2 \to Y_1$ , a  $\langle g_r \rangle$ -Galois covering  $f: X_2 \to X_1$  and the composition  $\rho_1 = \mathrm{Bl}_1 \ldots \mathrm{Bl}_r : X_1 \to Y_1$  of the blow downs of  $E(\beta_i)/\langle g_i \rangle = L_i \simeq \mathbb{P}^1(\mathbb{C})$ . If  $g_o : S_0 \to S_0$ induces isomorphisms  $L_{i,1} \to L_{i,2}$  of the irreducible components of  $E(\beta_i) = L_{i,1} \coprod L_{i,2}$  for all  $1 \leq i \leq r$ , we say that  $g_o$  is compatible with  $\rho_2 = \beta_1 \dots \beta_r$ .

**Proposition 17.** Let  $X = (\mathbb{B}/\Gamma)'$  be a smooth toroidal compactification,  $D := X \setminus (\mathbb{B}/\Gamma)$  be the toroidal compactifying divisor of  $\mathbb{B}/\Gamma$  and  $\rho = \beta_1 \dots \beta_r : X \to Y$  be a composition of blow downs onto a K3 surface Y. Then:

(i) X is a saturated compactification;

(ii) X is non-primitive exactly when there is a fixed point free involution  $g_o: Y \to Y$ , which is compatible with  $\rho$  and leaves invariant  $\rho(D)$ ;

(iii) if X is non-primitive then there is a fibered product commutative diagram

$$\begin{array}{ccc} X & \stackrel{\rho}{\longrightarrow} Y \\ f & & \varphi \\ X_0 & \stackrel{\rho_0}{\longrightarrow} Y_0 \end{array}$$

with a primitive smooth toroidal compactification  $X_0 = (\mathbb{B}/\Gamma_0)'$ , a composition of blow downs

 $\rho_0: X_0 \to Y_0$  onto a minimal Enriques surface  $Y_0$  and unramified double covers  $f: X \to X_0$ ,  $\varphi: Y \to Y_0$ .

*Proof.* (i) is an immediate consequence of  $\pi_1(Y) = \{1\}$ , according to Corollary 9.

(ii) and (iii) follow from Corollary 14 and the fact that a minimal projective surface  $Y_0$  admits an unramified covering  $\varphi: Y \to Y_0$  by a K3 surface Y if and only if  $Y_0$  is the quotient of Y by a fixed point free involution  $g_o: Y \to Y$ . Such  $Y_0 = Y/\langle g_o \rangle$  are called minimal Enriques surfaces and do not admit unramified coverings  $\varphi_0: Y_0 \to \varphi_0(Y_0)$  of degree > 1.

**Proposition 18.** Let  $X = (\mathbb{B}/\Gamma)'$  be a smooth toroidal compactification and  $\rho : \beta_1 \dots \beta_r : X \to Y$  be a composition of blow downs onto a minimal Enriques surface Y. Then:

(i) X is a primitive compactification;

(ii) X is not saturated;

(iii) there is an unramified double cover  $f: X_1 = \overline{\mathbb{B}/\Gamma_1} \to \overline{\mathbb{B}/\Gamma} = X$  by a saturated smooth toroidal compactification  $X_1 = (\mathbb{B}/\Gamma_1)'$  with K3 minimal model  $Y_1$ .

*Proof.* (i) is due to the lack of an unramified covering  $\varphi: Y \to \varphi(Y)$  of degree d > 1.

(ii) follows from  $\pi_1(Y) = (\mathbb{Z}_2, +) \neq \{1\}.$ 

(iii) is an immediate consequence of the Enriques-Kodaira classification of the smooth projective surfaces.

Let  $X = (\mathbb{B}/\Gamma)'$  be a smooth toroidal compactification with abelian or bi-elliptic minimal model Y. According to Theorem 1.3 from Di Cerbo and Stover's article [DiCerboStover2], X can be obtained from Y by blow up  $\beta : X \to Y$  of  $n \in \mathbb{N}$  points  $p_1, \ldots, p_n \in Y$ .

**Proposition 19.** Let  $X = (\mathbb{B}/\Gamma)'$  be a smooth toroidal compactification with a blow down  $\beta : X \to Y$  onto a minimal surface Y with exceptional divisor  $E(\beta) = \prod_{i=1}^{n} L_i$  and  $D := X \setminus (\mathbb{B}/\Gamma)$  be the toroidal compactifying divisor of  $\mathbb{B}/\Gamma$ . Then:

(i)  $\beta$  transforms  $E(\beta)$  onto the singular locus  $\beta(E(\beta)) = \beta(D)^{\text{sing}}$  of  $\beta(D) \subset Y$ ;

(ii) X is non-primitive if and only if there is an unramified covering  $\varphi : Y \to \varphi(Y)$  of degree d > 1, which restricts to an unramified covering  $\varphi : \beta(D) \to \varphi\beta(D)$  of degree d;

(iii) the relative automorphism group  $\operatorname{Aut}(Y,\beta(D)) = \operatorname{Aut}(Y,\beta(D),\beta(D)^{\operatorname{sing}})$  admits an isomorphism

$$\Phi: \operatorname{Aut}(Y,\beta(D)) \longrightarrow \operatorname{Aut}(X,D)$$

with the relative automorphism group  $Aut(X, D) = Aut(X, D, E(\beta));$ 

(iv)  $g_o \in \operatorname{Aut}(Y, \beta(D))$  is fixed point free if and only if it corresponds to a fixed point free  $g = \Phi(g_o) \in \operatorname{Aut}(X, D)$ .

*Proof.* (i) If  $D = \prod_{j=1}^{k} D_j$  has irreducible components  $D_j$  then the singular locus of  $\beta(D)$  is

$$\beta(D)^{\operatorname{sing}} = \left[ \bigcup_{j=1}^k \beta(D_j)^{\operatorname{sing}} \right] \cup \left[ \bigcup_{1 \le i < j \le k} \beta(D_i) \cap \beta(D_j) \right].$$

Since  $D_j$  are smooth irreducible elliptic curves,  $\beta(D)^{\text{sing}} \subseteq \beta(E(\beta))$ . Conversely, any (-1)curve  $L_i$  on  $X = (\mathbb{B}/\Gamma)'$  intersects  $D = \prod_{j=1}^k D_j$  in at least three points, due to the Kobayashi hyperbolicity of  $\mathbb{B}/\Gamma$ . In fact,  $|L_i \cap F| \ge 4$ , according to Theorem 1.1 (2) from Di Cerbo and Stover's article [DiCerboStover2]. Therefore, the multiplicity of  $\beta(L_i) = p_i$  with respect to  $\beta(D)$  is  $\ge 4$  and  $p_i \in \beta(D)^{\text{sing}}$ . That justifies  $\beta(E(\beta)) \subseteq \beta(D)^{\text{sing}}$  and  $\beta(E(\beta)) = \beta(D)^{\text{sing}}$ .

(ii) By Corollary 14 and (i),  $X = (\mathbb{B}/\Gamma)'$  is non-primitive if and only if there is an unramified covering  $\varphi : Y \to \varphi(Y)$  of degree d > 1, which restricts to unramified coverings  $\varphi : \beta(D) \to \varphi\beta(D)$  and  $\varphi : \beta(D)^{\text{sing}} \to \beta(D)^{\text{sing}}$  of degree d. Let us observe that any unramified covering  $\varphi : \beta(D) \to \varphi\beta(D)$  of degree d restricts to an unramified covering  $\varphi : \beta(D) \to \varphi\beta(D)$  of degree d restricts to an unramified covering  $\varphi : \beta(D)^{\text{sing}} \to \beta(D)^{\text{sing}}$  of degree d, as far as the local biholomorphism  $\varphi : \beta(D) \to \varphi\beta(D)$  preserves the multiplicities of the points with respect to  $\beta(D)$  and  $\beta(D)^{\text{sing}}$  consists of the points of  $\beta(D)$  of multiplicity  $\geq 2$ .

(iii) If a holomorphic automorphism  $g_o: Y \to Y$  restricts to a holomorphic automorphism  $g_o: \beta(D) \to \beta(D)$  then  $g_o$  preserves the multiplicities of the points with respect to  $\beta(D)$  and  $\beta(D)^{\text{sing}}$  is  $\langle g_o \rangle$ -invariant. That justifies  $\operatorname{Aut}(Y, \beta(D)) \leq \operatorname{Aut}(Y, \beta(D), \beta(D)^{\text{sing}})$  and  $\operatorname{Aut}(Y, \beta(D)) = \operatorname{Aut}(Y, \beta(D), \beta(D)^{\text{sing}})$ .

In order to show the existence of a group isomorphism

$$\Phi: \operatorname{Aut}(Y,\beta(D),\beta(D)^{\operatorname{sing}}) \longrightarrow \operatorname{Aut}(X,D,E(\beta)),$$

let us pick up  $g_o \in \operatorname{Aut}(Y, \beta(D), \beta(D)^{\operatorname{sing}})$ . Then  $X \setminus E(\beta) = Y \setminus \beta(E(\beta)) = Y \setminus \beta(D)^{\operatorname{sing}}$ is acted by  $\Phi(g_o)|_{X \setminus E(\beta)} := g_o|_{Y \setminus \beta(D)^{\operatorname{sing}}}$ . By the very definition of a blow up at a point, the bijection  $g_o : \beta(D)^{\operatorname{sing}} \to \beta(D)^{\operatorname{sing}}$  with  $g_o(\beta(L_{1,i})) = \beta(L_{1,j})$  induces isomorphisms  $\Phi(g_o) : L_{1,i} \to L_{1,j}$  and provides an element  $\Phi(g_o) \in \operatorname{Aut}(X, E(\beta))$ . After observing that  $\Phi(g_o)(D \setminus E(\beta)) = g_o(\beta(D) \setminus \beta(D)^{\operatorname{sing}}) = \beta(D) \setminus \beta(D)^{\operatorname{sing}} = D \setminus E(\beta)$ , one concludes that  $\Phi(g_o)$  transforms the Zariski closure D of  $D \setminus E(\beta)$  onto itself and  $\Phi(g_o) \in \operatorname{Aut}(D)$ .

The correspondence  $\Phi$  is a group homomorphism since  $g_o$  and  $\Phi(g_o)$  coincide on Zariski open subsets of Y, respectively, X. Towards the bijectiveness of  $\Phi$ , let  $g \in \operatorname{Aut}(X, D, E(\beta))$ and note that  $Y \setminus \beta(D)^{\operatorname{sing}} = X \setminus E(\beta)$ . That allows to define  $\phi^{-1}(g)|_{Y \setminus \beta(D)^{\operatorname{sing}}} := g|_{X \setminus E(\beta)}$ . The isomorphism  $g : E(\beta) \to E(\beta)$  of the exceptional divisor  $E(\beta)$  of  $\beta$  induces a permutation  $\Phi^{-1}(g) : \beta(D)^{\operatorname{sing}} \to \beta(D)^{\operatorname{sing}}$  of the finite set  $\beta(D)^{\operatorname{sing}}$  and provides an automorphism  $\Phi^{-1}(g) \in \operatorname{Aut}(Y, \beta(D)^{\operatorname{sing}})$ . Bearing in mind that  $\Phi^{-1}(g)(\beta(D) \setminus \beta(D)^{\operatorname{sing}}) = g(D \setminus E(\beta)) =$  $D \setminus E(\beta) = \beta(D) \setminus \beta(D)^{\operatorname{sing}}$ , one concludes that  $\Phi^{-1}(g) \in \operatorname{Aut}(\beta(D))$  is an automorphism of the Zariski closure  $\beta(D)$  of  $\beta(D) \setminus \beta(D)^{\operatorname{sing}} = \beta(D)^{\operatorname{smooth}}$ .

Note that any automorphism  $g \in \operatorname{Aut}(X, D)$  acts on the set of the smooth irreducible rational curves on X. Moreover, g preserves the self-intersection number of such a curve and  $\langle g \rangle$  acts on the set  $E(\beta) = \prod_{i=1}^{n} L_i$  of the (-1)-curves on X. Thus,  $g \in \operatorname{Aut}(X, D, E(\beta))$ and  $\operatorname{Aut}(X, D) \subseteq \operatorname{Aut}(X, D, E(\beta))$ , whereas  $\operatorname{Aut}(X, D, E(\beta)) = \operatorname{Aut}(X, D)$ .

(iv) If  $g \in \operatorname{Aut}(X, D)$  has no fixed points on X then  $g_o := \Phi^{-1}(g) \in \operatorname{Aut}(Y, \beta(D))$ restricts to  $g_o|_{Y \setminus \beta(E(\beta))} = g|_{X \setminus E(\beta)}$  without fixed points. The assumption  $g_o(p_i) = p_i =$  $\operatorname{Bl}(L_i)$  for some  $1 \leq i \leq n$  implies that g restricts to an automorphism  $g : L_i \to L_i$ . Any biholomorphism  $g \in \operatorname{Aut}(L_i) = \operatorname{Aut}(\mathbb{P}^1(\mathbb{C})) = PGL(2, \mathbb{C})$  of the projective line  $L_i = \mathbb{P}^1(\mathbb{C})$  is a fractional linear transformation and has two fixed points, counted with their multiplicities. That contradicts the lack of fixed points of g on X and implies that the associated automorphism  $g_o = \Phi^{-1}(g) \in \operatorname{Aut}(Y, \beta(D))$  has no fixed points on Y.

Conversely, if  $g_o \in \operatorname{Aut}(Y,\beta(D))$  has no fixed points on Y and  $g := \Phi(g_o)$  then the restriction  $g|_{X\setminus E(\beta)} = g_o|_{Y\setminus\beta(\beta)}$  has no fixed points. If g(x) = x for some  $x \in E(\beta) = \prod_{i=1}^n L_i$  then  $x \in L_i$  for some  $1 \le i \le n$  and  $g(L_i) = L_i$ . As a result,  $g_o$  fixes  $p_i = \beta(L_i) \in Y$ , which is an absurd. In such a way, any fixed point free  $g_o \in \operatorname{Aut}(Y,\beta(D))$  corresponds to a fixed point free  $g = \Phi(g_o) \in \operatorname{Aut}(X,D)$ .

**Proposition 20.** Let  $X = (\mathbb{B}/\Gamma)'$  be a smooth toroidal compactification with toroidal compactifying divisor  $D := X \setminus (\mathbb{B}/\Gamma)$  and a blow down  $\beta : X \to Y$  of  $n \in \mathbb{N}$  smooth irreducible rational (-1)-curves. Then  $\operatorname{Aut}(X, D)$  is a finite group.

Proof. By Proposition 19 (iii),  $\operatorname{Aut}(X, D) = \operatorname{Aut}(X, D, E(\beta))$ . Any  $g \in \operatorname{Aut}(X, D)$  acts on  $D = \prod_{j=1}^{k} D_j$  and induces a permutation of the smooth elliptic irreducible components  $D_1$ , ...,  $D_k$  of D. In such a way, there arises a representation

$$\Sigma_1 : \operatorname{Aut}(X, D) \longrightarrow \operatorname{Sym}(D_1, \dots, D_k) = \operatorname{Sym}(k).$$

The image of  $\Sigma_1$  in the finite group  $\operatorname{Sym}(k)$  is a finite group, so that it suffices to show the finiteness of  $\operatorname{ker}(\Sigma_1)$ , in order to conclude that  $\operatorname{Aut}(X, D)$  is a finite group. Similarly,  $\operatorname{Aut}(X, D) = \operatorname{Aut}(X, D, E(\beta))$  acts on the exceptional divisor  $E(\beta) = \prod_{i=1}^{n} L_i$  of  $\beta: X \to Y$ and defines a representation

$$\Sigma_2$$
: Aut $(X, D) \longrightarrow$  Sym $(L_1, \ldots, L_n) =$  Sym $(n)$ .

Since  $\Sigma_2(\ker(\Sigma_1))$  is a finite group, it suffices to show that  $G := \ker(\Sigma_2) \cap \ker(\Sigma_1)$  is a finite group. For any  $1 \le i \le n, 1 \le j \le k$  and  $g \in G$ , the finite set  $L_i \cap D_j$  is transformed into itself, according to  $g(L_i \cap D_j) \subseteq g(L_i) \cap g(D_j) = L_i \cap D_j$ . Therefore, there is a representation

$$\Sigma_{i,j}: G \longrightarrow \operatorname{Sym}(L_i \cap D_j).$$

The image  $\Sigma_{i,j}(G)$  is a finite group, while the kernel  $K_{i,j} := \ker(\Sigma_{i,j})$  fixes any point  $p \in L_i \cap D_j$  and acts on  $D_j$ . It is well known that the holomorphic automorphisms  $\operatorname{Aut}_p(D_j)$  of an elliptic curves  $D_j$ , which fix a point  $p \in D_j$  form a cyclic group of order 2, 4 or 6. Therefore,  $K_{i,j} \leq \operatorname{Aut}_p(D)$ , G,  $\operatorname{ker}(\Sigma_1)$  and  $\operatorname{Aut}(X, D)$  are finite groups.

**Definition 21.** A smooth toroidal compactification  $X = (\mathbb{B}/\Gamma)'$  with a blow down  $\beta : X \to Y$ of  $n \in \mathbb{N}$  smooth irreducible rational (-1)-curves onto a minimal surface Y is Galois nonprimitive if there is a fixed point free automorphism  $g \in \operatorname{Aut}(X, D) \setminus \{\operatorname{Id}_X\}$ .

Any Galois non-primitive  $X = (\mathbb{B}/\Gamma)'$  is non-primitive, because the  $\langle g \rangle$ -Galois covering  $\zeta : X \to \zeta(X) = X/\langle g \rangle$  is unramified and restricts to unramified coverings  $\zeta : \mathbb{B}/\Gamma \to \zeta(\mathbb{B}/\Gamma)$ and  $\zeta : E(\beta) = \prod_{i=1}^{n} L_i \to \zeta(E(\beta))$  of degree  $|\langle g \rangle| = \operatorname{ord}(g)$ . Note that the presence of an unramified covering  $\varphi: Y \to \varphi(Y)$  implies the coincidence  $\widetilde{Y} = \widetilde{\varphi(Y)}$  of the universal cover  $\widetilde{Y}$  of Y with the universal cover  $\widetilde{\varphi(Y)}$  of  $\varphi(Y)$ . The fundamental group  $\pi_1(\varphi(Y))$  of  $\varphi(Y)$  acts on  $\widetilde{Y}$  by biholomorphic automorphisms without fixed points and contains the fundamental group  $\pi_1(Y)$  of Y as a subgroup of index  $[\pi_1(\varphi(Y)):\pi_1(Y)] = d.$ 

**Proposition 22.** Let  $X = (\mathbb{B}/\Gamma)'$  be a smooth toroidal compactification with toroidal compactifying divisor  $D := X \setminus (\mathbb{B}/\Gamma)$ ,  $\beta : X \to Y$  be a blow down of  $n \in \mathbb{N}$  smooth irreducible rational (-1)-curves to a minimal surface Y and  $N(\pi_1(Y))$  be the normalizer of the fundamental group  $\pi_1(Y)$  of Y in the biholomorphism group  $\operatorname{Aut}(\widetilde{Y})$  of the universal cover  $\widetilde{Y}$ of Y. Then X is Galois non-primitive if and only if there exist a natural divisor d > 1 of  $\operatorname{GCD}(|\beta(D)^{\operatorname{sing}}|, e(Y)) \in \mathbb{N}$  and an unramified covering  $\varphi : Y \to \varphi(Y)$  of degree d, such that  $\pi_1(\varphi(Y)) \cap N(\pi_1(Y)) \geq \pi_1(Y)$  and  $\varphi : \beta(D) \to \varphi\beta(D)$  is an unramified covering of degree d.

Proof. If  $X = (\mathbb{B}/\Gamma)'$  is Galois non-primitive then there exists a fixed point free biholomorphism  $g \in \operatorname{Aut}(X, D) \setminus {\operatorname{Id}_X}$  of X. By Proposition 19(iv), g induces a fixed point free biholomorphism  $g_o = \Phi^{-1}(g) \in \operatorname{Aut}(Y, \beta(D)) \setminus {\operatorname{Id}_Y}$  of Y. The element  $g_o$  of the finite group  $\operatorname{Aut}(Y, \beta(D))$  is of finite order  $d \in \mathbb{N} \setminus {1}$  and the  $\langle g_o \rangle$ -Galois coverings  $\zeta : Y \to Y/\langle g_o \rangle$ ,  $\zeta : \beta(D) \to \zeta\beta(D)$  are unramified and of degree d. The automorphism  $g_o$  of Y lifts to an automorphism  $\sigma \in \operatorname{Aut}(\widetilde{Y})$  of the universal cover  $\widetilde{Y}$  of Y, which normalizes  $\pi_1(Y)$  and belongs to

$$\pi_1(\zeta(Y)) = \pi_1(Y/\langle g_o \rangle) = \pi_1\left((\widetilde{Y}/\pi_1(Y))/\langle \sigma \pi_1(Y) \rangle\right) = \pi_1\left(\widetilde{Y}/\langle \sigma, \pi_1(Y) \rangle\right) = \langle \sigma, \pi_1(Y) \rangle.$$

Conversely, suppose that  $\varphi : Y \to \varphi(Y)$  is an unramified covering of degree d > 1, which restricts to an unramified covering  $\varphi : \beta(D) \to \varphi\beta(D)$  of degree d and there exists  $\sigma \in [\pi_1(\varphi(Y)) \cap N(\pi_1(Y))] \setminus \pi_1(Y)$ . Then  $g_o := \sigma \pi_1(Y) \in \operatorname{Aut}(Y) = N(\pi_1(Y))/\pi_1(Y)$  is a non-identical biholomorphism  $g_o : Y \to Y$ . Since  $\langle \sigma, \pi_1(Y) \rangle$  is a subgroup of  $\pi_1(\varphi(Y))$ , the unramified covering  $\varphi : Y \to \varphi(Y)$  factors through the  $\langle g_o \rangle$ -Galois covering  $\zeta : Y \to Y/\langle g_o \rangle$ and a covering  $\varphi_o : Y/\langle g_o \rangle \to \varphi(Y)$  along the commutative diagram

The finite coverings  $\zeta: Y \to Y/\langle g_o \rangle$  and  $\varphi_o: Y/\langle g_o \rangle \to \varphi(Y)$  are unramified, because their composition  $\varphi = \varphi_o \zeta: Y \to \varphi(Y)$  is unramified. That is why,  $g_o$  has no fixed points on Y. If  $\beta(D) \subset Y$  is not  $\langle g_o \rangle$ -invariant then there is an orbit  $\operatorname{Orb}_{\langle g_o \rangle}(y_o) \subset Y$  of some  $y_o \in \beta(D)$ which intersects, both,  $\beta(D)$  and  $Y \setminus \beta(D)$ . Therefore,  $\zeta: \beta(D) \to \zeta\beta(D)$  has a fibre  $\zeta^{-1}(\zeta(y_o))$  of cardinality  $|\zeta^{-1}(\zeta(y_o))| < \operatorname{deg}(\zeta) = |\langle g_o \rangle| = \operatorname{ord}(g_o)$  and  $\zeta: \beta(D) \to \zeta\beta(D)$ is ramified. As a result, the composition  $\varphi = \varphi_o \zeta: \beta(D) \to \varphi\beta(D)$  is ramified. The contradiction shows the  $\langle g_o \rangle$ -invariance of  $\beta(D)$ . According to Proposition 19 (iv), the fixed point free  $g_o \in \operatorname{Aut}(Y, \beta(D)) \setminus {\operatorname{Id}_Y}$  corresponds to a fixed point free  $g = \Phi(g_o) \in \operatorname{Aut}(X, D) \setminus {\operatorname{Id}_X}$  and X is Galois non-primitive.

**Definition 23.** A covering  $\varphi : Y \to \varphi(Y)$  by a smooth projective surface Y has Galois factorization if there exist  $g_o \in \operatorname{Aut}(Y) \setminus \{\operatorname{Id}_Y\}$  and a covering  $\varphi_o : Y/\langle g_o \rangle \to \varphi(Y)$ , such that  $\varphi = \varphi_o \zeta$  gactors through the  $\langle g_o \rangle$ -Galois covering  $\zeta : Y \to Y/\langle g_o \rangle$  and a covering  $\varphi_o$ along the commutative diagram (6).

Now, Proposition 22 can be reformulated in the form of the following

**Corollary 24.** Let  $X = (\mathbb{B}/\Gamma)'$  be a non-primitive smooth toroidal compactification with toroidal compactifying divisor  $D := X \setminus (\mathbb{B}/\Gamma)$ ,  $\beta : X \to Y$  be a blow down of  $n \in \mathbb{N}$ smooth irreducible rational (-1)-curves onto a minimal surface Y and  $\varphi : Y \to \varphi(Y)$  be an unramified covering of degree d, which restricts to an unramified covering  $\varphi : \beta(D) \to \varphi\beta(D)$ of degree d. Then X is Galois non-primitive if and only if  $\varphi$  admits a Galois factorization.

**Corollary 25.** (i) Let  $X = (\mathbb{B}/\Gamma)'$  be a smooth toroidal compactification with abelian minimal model Y. Then X is not saturated and X is non-primitive if and only if it is Galois non-primitive.

(ii) If  $X = (\mathbb{B}/\Gamma)'$  is a smooth toroidal compactification with bi-elliptic minimal model Y then X is not saturated.

*Proof.* (i) Any abelian surface Y has non-trivial fundamental group  $\pi_1(Y) \simeq (\mathbb{Z}^4, +)$ . According to Corollary 9, that suffices for a smooth toroidal compactification  $X = (\mathbb{B}/\Gamma)'$  with abelian minimal model Y to be non-saturated.

By Theorem 1.3 from Di Cerbo and Stover's article [DiCerboStover2], if a smooth toroidal compactification  $X = (\mathbb{B}/\Gamma)'$  has abelian minimal model Y then there is a blow down  $\beta : X \to Y$  of  $n \in \mathbb{N}$  smooth irreducible rational (-1)-curves on X onto Y. Such X is non-primitive exactly when there exists an unramified covering  $\varphi : Y \to \varphi(Y)$  of degree d > 1, which restricts to an unramified covering  $\varphi : \beta(D) \to \varphi\beta(D)$  of degree d. Since Y and  $\varphi(Y)$  have one and a same universal cover  $\widehat{\varphi(Y)} = \widetilde{Y} = \mathbb{C}^2$  and one and a same Kodaira dimension  $\kappa(\varphi(Y)) = \kappa(Y) = 0$ , the minimal smooth irreducible projective surface  $\varphi(Y)$  is abelian or bi-elliptic.

If  $\varphi(Y)$  is an abelian surface then its fundamental group  $\pi_1(\varphi(Y)) \simeq (\mathbb{Z}^4, +)$  is abelian and  $\pi_1(Y) \simeq (\mathbb{Z}^4, +)$  is a normal subgroup of  $\pi_1(\varphi(Y))$ . As a result,  $\varphi: Y \to \varphi(Y)$  is a  $\pi_1(\varphi(Y))/\pi_1(Y)$ -Galois covering and Y is Galois non-primitive.

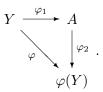

Let us suppose that  $\varphi(Y)$  is a bi-elliptic surface. According to Bagnera-de Franchis classification of the bi-elliptic surfaces from [BagneraDeFranchis], there is an abelian surface A and a cyclic subgroup  $\langle g \rangle \leq \operatorname{Aut}(A)$  of order  $d \in \{2,3,4,6\}$  with a non-translation generator  $g \in \operatorname{Aut}(A)$ , such that  $\varphi(Y) = A/\langle g \rangle$ . Let  $\operatorname{AffLin}(\mathbb{C}) := \mathcal{T}(\mathbb{C}^2) \rtimes \operatorname{GL}(2,\mathbb{C})$  be the group of the affine linear transformations of  $\mathbb{C}^2 = \widetilde{Y} = \widetilde{\varphi(Y)} = \widetilde{A}$  and

$$\mathcal{L}: \operatorname{AffLin}(\mathbb{C}^2) \longrightarrow \operatorname{GL}(2,\mathbb{C})$$

be the group homomorphism, associating to  $\sigma \in \operatorname{AffLin}(\mathbb{C}^2)$  its linear part  $\mathcal{L}(\sigma) \in \operatorname{GL}(2,\mathbb{C})$ . Then the fundamental group of A is the maximal translation subgroup

$$\pi_1(A) = \pi_1(\varphi(Y)) \cap \ker(\mathcal{L})$$

of  $\pi_1(\varphi(Y))$ . The translation subgroup  $\pi_1(Y) \leq \pi_1(\varphi(Y)) \cap \ker(\mathcal{L})$  of  $\pi_1(\varphi(Y))$  is contained in  $\pi_1(A)$  and the unramified covering  $\varphi: Y \to \varphi(Y)$  factors through unramified coverings  $\varphi_1: Y \to A$  and  $\varphi_2: A \to \varphi(Y)$ , along the commutative diagram

The covering  $\varphi_1: Y \to A$  is  $\pi_1(A)/\pi_1(Y)$ -Galois, so that  $\varphi = \varphi_2 \varphi_1$  is a Galois factorization of  $\varphi$  for  $\pi_1(Y) \leq \pi_1(A)$ . In the case of  $\pi_1(Y) = \pi_1(A)$ , there is an isomorphism  $Y \simeq \mathbb{C}^2/\pi_1(Y) \simeq \mathbb{C}^2/\pi_1(A) = A$  and the covering  $\varphi: Y \simeq A \to \varphi(Y) = A/\langle g \rangle$  is  $\langle g \rangle$ -Galois. Thus, X is Galois non-primitive and a co-abelian smooth toroidal compactification  $X = (\mathbb{B}/\Gamma)'$  is non-primitive if and only if it is Galois non-primitive.

(ii) The fundamental group  $\pi_1(Y)$  of a bi-elliptic surface Y is subject to an exact sequence

$$1 \longrightarrow \pi_1(Y) \cap \ker(\mathcal{L}) \longrightarrow \pi_1(Y) \longrightarrow \langle g \rangle \longrightarrow 1$$

with a non-translation cyclic subgroup  $\langle g \rangle$  of Aut  $(\mathbb{C}^2/\pi_1(Y) \cap \ker(\mathcal{L})) = \operatorname{Aut}(A_o)$  of order 2, 3, 4 or 6. In particular, Y is not simply connected and a smooth toroidal compactification  $X = (\mathbb{B}/\Gamma)'$  with bi-elliptic minimal model Y is not saturated.
