

Unit Code MA3 0087		Unit Title OPTIMISATION METHODS OF OPERATIONAL RESEARCH	
Academic Year 2003/4		Examiner M E BRIDEN	
Semester 1		Question No. 1	Page 1 of 2
Part			Mark
(a)	Suppose $\underline{x}^0$ is an optimal solution with exactly p variables positive. Without loss of generality take $\underline{x}^0$ to be of form $\underline{x}^0 = (x_1^0, x_2^0, \dots, x_p^0, 0, \dots, 0)^T$ with $x_i^0 > 0 \quad i = 1, \dots, p$. Either (i) $a_1, a_2, \dots, a_p$ are l.i. when $\underline{x}^0$ is basic or (ii) can write $t_1 a_1 + t_2 a_2 + \dots + t_p a_p = 0 \quad \text{--- (1)}$ with at least one $t_i > 0$. Since $\underline{x}^0$ satisfies constraints, $x_1^0 a_1 + x_2^0 a_2 + \dots + x_p^0 a_p = \underline{b} \quad \text{--- (2)}$ (2) - ϵ(1) gives $\sum_{i=1}^p (x_i^0 - \epsilon t_i) a_i = \underline{b} \quad \text{--- (3)}$ Define $\delta_1 = \max_{t_i < 0} \left(\frac{x_i^0}{t_i} \right) \quad \text{or} = -\infty \quad \text{if all } t_i \geq 0$ $\delta_2 = \min_{t_i > 0} \left(\frac{x_i^0}{t_i} \right)$ then for $\delta_1 \leq \epsilon \leq \delta_2$ the new solution $\left. \begin{aligned} x_i &= x_i^0 - \epsilon t_i & i &= 1, \dots, p \\ &= 0 & i &= p+1, \dots, n \end{aligned} \right\}$ is feasible. By optimality of $\underline{x}^0$ $\sum_{i=1}^p c_i x_i^0 \geq \sum_{i=1}^p c_i (x_i^0 - \epsilon t_i) \quad \forall \epsilon \in [\delta_1, \delta_2]$ i.e. $\epsilon \sum_{i=1}^p c_i t_i \geq 0 \quad \forall \epsilon \in [\delta_1, \delta_2]$ Since $\delta_1 < 0$ and $\delta_2 > 0$ this implies $\sum_{i=1}^p c_i t_i = 0$

Part			Mark
	(Cont) $\text{and } \sum_{i=1}^p c_i x_i^0 = \sum_{i=1}^p c_i (x_i^0 - \varepsilon t_i)$ so the new solution is also optimal. Thus setting $\varepsilon = \delta_2$ gives an optimal solution $x_i = x_i^0 - \delta_2 t_i \quad i=1, \dots, p$ $= 0 \quad i = (p+1), \dots, n$ and by virtue of the definition of δ_2, this has at most $(p-1)$ variables that are positive. The whole argument can be repeated until case (i) at start occurs when an optimal basic feasible solution will have been created. Bookwork but hard to get correct in exam conditions (b) Create 2 new variables x_i^+ and x_i^- such that $x_i = x_i^+ - x_i^-, \quad x_i^+, x_i^- \geq 0 \quad x_i^+ x_i^- = 0$ Then the problem becomes the L.P. :- Maximise $c_1 x_i^+ + c_1 x_i^- + \sum_{j=2}^n c_j x_j$ subject to $a_{i1} (x_i^+ - x_i^-) + \sum_{j=2}^n a_{ij} x_j = b_i \quad i=1, \dots, m$ $x_i^+, x_i^- \geq 0, \quad x_j \geq 0 \quad j=2, \dots, n$ If a_i^+ and a_i^- are columns of x_i^+ and x_i^- in the constraint system then $a_i^+ = -a_i^-$. No basic solution can have both x_i^+ and x_i^- as basic variables so in any basic solution the non linear $x_i^+ x_i^- = 0 \quad \text{is automatically satisfied.}$ Not routine. Tests understanding.		14 3 3
