Attraction to and repulsion from patches on the hypersphere and hyperplane for isotropic d-dimensional α -stable processes with index in $\alpha \in (0,1]$ and $d \geq 2$.

Andreas Kyprianou Joint work with: Tsogzolmaa Saizmaa (National University of Mongolia) Sandra Palau (National Autonomous University of Mexico) Matthias Kwasniki (Wroclaw Technical University)

Isotropic α -stable process in dimension $d \geq 2$

For $d \ge 2$, let $X := (X_t : t \ge 0)$ be a d-dimensional isotropic stable process.

- ▶ *X* has stationary and independent increments (it is a Lévy process)
- Characteristic exponent $\Psi(\theta) = -\log \mathbb{E}_0(e^{i\theta \cdot X_1})$ satisfies

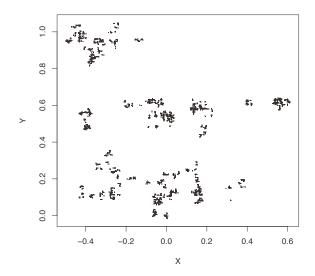

$$\Psi(\theta) = |\theta|^{\alpha}, \quad \theta \in \mathbb{R}.$$

- Necessarily, $\alpha \in (0,2]$, we exclude 2 as it pertains to the setting of a Brownian motion.
- ► Associated Lévy measure satisfies, for $B \in \mathcal{B}(\mathbb{R}^d)$,

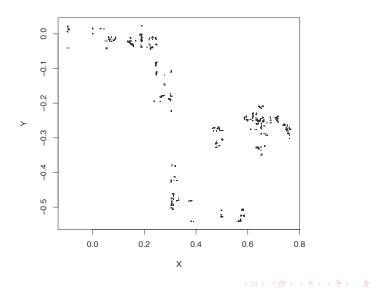

$$\Pi(B) = \frac{2^{\alpha} \Gamma((d+\alpha)/2)}{\pi^{d/2} |\Gamma(-\alpha/2)|} \int_{B} \frac{1}{|y|^{\alpha+d}} dy.$$

▶ *X* is Markovian with probabilities denoted by \mathbb{P}_x , $x \in \mathbb{R}^d$

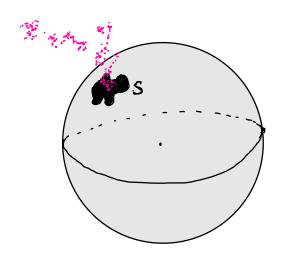

Sample path, $\alpha=1.2$

Sample path, $\alpha = 0.9$

CONDITIONING TO HIT A PATCH ON A UNIT SPHERE FROM OUTSIDE

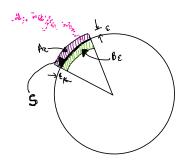

Conditioning to continuously hit $S \subseteq \mathbb{S}^{d-1}$ from outside

- ▶ Recall $d \ge 2$, the process (X, \mathbb{P}) is transient in the sense that $\lim_{t\to\infty} |X_t| = \infty$ almost surely.
- Define

$$\underline{G}(t) := \sup\{s \le t \colon |X_s| = \inf_{u \le s} |X_u|\}, \qquad t \ge 0,$$

- ▶ Transience of (X, \mathbb{P}) means $\underline{G}(\infty) := \lim_{t \to \infty} \underline{G}(t)$ describes the point of closest reach to the origin in the range of X.
- $A_{\varepsilon} = \{ r\theta : r \in (1, 1 + \varepsilon), \theta \in S \} \text{ and } B_{\varepsilon} = \{ r\theta : r \in (1 \varepsilon, 1), \theta \in S \}, \text{ for } 0 < \varepsilon < 1 \}$

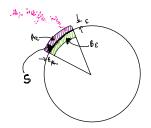

Conditioning to continuously hit $S \subseteq \mathbb{S}^{d-1}$ from outside

We are interested in the asymptotic conditioning

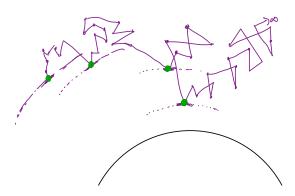

$$\mathbb{P}_{x}^{S}(A, t < \zeta) = \lim_{\varepsilon \to 0} \mathbb{P}_{x}(A, t < \tau_{1}^{\oplus} | C_{\varepsilon}^{S}), \qquad A \in \sigma(\xi_{u} : u \le t),$$

where $\tau_1^{\oplus} = \inf\{t > 0 : |X_t| < 1\}$ and $C_{\varepsilon}^S := \{X_{\underline{G}(\infty)} \in A_{\varepsilon}\}.$

▶ Works equally well if we replace $C_{\varepsilon}^{S} := \{X_{\underline{C}(\infty)} \in A_{\varepsilon}\}$ by $C_{\varepsilon}^{S} = \{X_{\tau_{1}^{\oplus}} \in B_{\varepsilon}\}$, or indeed $C_{\varepsilon}^{S} = \{X_{\tau_{1}^{\oplus}} = A_{\varepsilon}\}$

POINT OF CLOSEST REACH¹

Recent work: For |x| > |z| > 0,

$$\mathbb{P}_x(X_{\underline{G}(\infty)} \in dz) = \pi^{-d/2} \frac{\Gamma(d/2)^2}{\Gamma((d-\alpha)/2)\Gamma(\alpha/2)} \frac{(|x|^2 - |z|^2)^{\alpha/2}}{|z|^{\alpha}} |x - z|^{-d} dz,$$

Conditioning to continuously hit $S \subseteq \mathbb{S}^{d-1}$ from outside

▶ Remember $C_{\varepsilon}^S := \{X_{G(\infty)} \in A_{\varepsilon}\}$, switch to generalised polar coordinates and estimate

$$\lim_{\varepsilon \to 0} \varepsilon^{\alpha - d} \mathbb{P}_x(C^S_\varepsilon) = c_{\alpha, d} \int_S (|x|^2 - 1)^{\alpha/2} |x - \theta|^{-d} \sigma_1(\mathrm{d}\,\theta),$$

where $c_{\alpha,d}$ does not depend on x or S and σ_1 is the unit surface measure on \mathbb{S}^{d-1} .

Use

$$\mathbb{P}_{x}(A, t < \tau_{\beta}^{\oplus} | C_{\varepsilon}^{S}) = \mathbb{E}_{x} \left[\mathbf{1}_{\{A, t < \tau_{\beta}^{\oplus}\}} \frac{\mathbb{P}_{X_{t}}(C_{\varepsilon}^{S})}{\mathbb{P}_{x}(C_{\varepsilon}^{S})} \right], \qquad A \in \sigma(\xi_{u} : u \leq t),$$

pass the limit through the expectation on the RHS (carefully with DCT!) to get

$$\frac{d\mathbb{P}_{x}^{S}}{d\mathbb{P}_{x}}\Big|_{\mathcal{F}_{t}} = \mathbf{1}_{(t < \tau_{1}^{\oplus})} \frac{M_{S}(X_{t})}{M_{S}(x)}, \quad \text{if } x \in \bar{\mathbb{B}}_{d}^{c}$$

with

$$M_S(x) = \begin{cases} \int_S |\theta - x|^{-d} ||x|^2 - 1|^{\alpha/2} \sigma_1(\mathrm{d}\theta) & \text{if } \sigma_1(S) > 0 \\ \\ |\vartheta - x|^{-d} ||x|^2 - 1|^{\alpha/2} & \text{if } S = \{\vartheta\}, \end{cases}$$

which is a superharmonic function.

DECOUPLING HITTING POSITION

Suppose ζ is the lifetime of (X, \mathbb{P}^S) . Let S' be an open subset of S. Then for any $x \in \mathbb{R}^d \setminus \overline{\mathbb{B}}_d$, we have

$$\mathbb{P}_x^S(X_{\zeta-} \in S') = \frac{\int_{S'} |\theta - x|^{-d} \sigma_1(\mathrm{d}\theta)}{\int_{S} |\theta - x|^{-d} \sigma_1(\mathrm{d}\theta)},$$

▶ Hence, for $\theta \in S$,

$$\begin{split} \mathbb{P}_{x}^{S}(A|X_{\zeta-} = \theta) &= \mathbb{E}_{x}^{S} \left[\mathbf{1}_{\varepsilon} \frac{\mathbb{P}_{X_{t}}^{S}(X_{\zeta-} = \theta)}{\mathbb{P}_{x}^{S}(X_{\zeta-} = \theta)} \right] \\ &= \mathbb{E}_{x} \left[\mathbf{1}_{(A, t < \tau_{1}^{\oplus})} \frac{M_{S}(X_{t})}{M_{S}(x)} \frac{M_{\{\theta\}}(X_{t})}{M_{S}(X_{t})} \frac{M_{S}(x)}{M_{\{\theta\}}(x)} \right] \\ &= \mathbb{E}_{x} \left[\mathbf{1}_{(A, t < \tau_{1}^{\oplus})} \frac{M_{\{\theta\}}(X_{t})}{M_{\{\theta\}}(x)} \right] \\ &= \mathbb{P}_{x}^{\{\theta\}}(A), \qquad A \in \sigma(\xi_{u} : u \leq t) \end{split}$$

► So

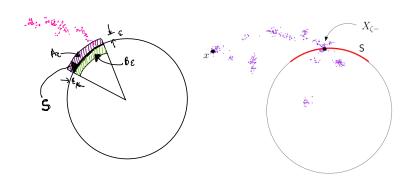

$$\mathbb{P}_{x}^{S}(A) = \int_{S} \mathbb{P}_{x}^{\{\theta\}}(A) \frac{|\theta - x|^{-d} \sigma_{1}(\mathrm{d}\theta)}{\int_{S} |\theta - x|^{-d} \sigma_{1}(\mathrm{d}\theta)}.$$

"pick a target uniformly in *S* with the terminal strike distribution and condition to hit it."

10/21

Conditioning to continuously hit $S \subseteq \mathbb{S}^{d-1}$ from either side

Now define

$$\mathbb{P}_{x}^{S}(A, t < \zeta) = \lim_{\varepsilon \to 0} \mathbb{P}_{x} \left(A \middle| \tau_{S_{\varepsilon}} < \infty \right),$$

where

$$\tau_{S_{\varepsilon}} = \inf\{t > 0 : X_t \in S_{\varepsilon}\} \text{ and } S_{\varepsilon} := A_{\varepsilon} \cup B_{\varepsilon}.$$

Note: need to insist on $\alpha \in (0,1]$ because $\mathbb{P}_x(\tau_S < \infty) > 0$ if $\alpha \in (1,2)$.

Conditioning to continuously hit $S \subseteq \mathbb{S}^{d-1}$ from either side

Theorem

Suppose that $\alpha \in (0,1]$ and the closed set $S \subseteq \mathbb{S}^{d-1}$ is such that $\sigma_1(S) > 0$. For $\alpha \in (0,1]$, the process (X, \mathbb{P}^S) is well defined such that

$$\frac{\mathrm{d}\,\mathbb{P}_{x}^{S}}{\mathrm{d}\,\mathbb{P}_{x}}\bigg|_{\mathcal{F}_{t}} = \frac{H_{S}(X_{t})}{H_{S}(x)}, \qquad t \geq 0, x \not\in S,\tag{1}$$

where

$$H_S(x) = \int_S |x - \theta|^{\alpha - d} \sigma_1(d\theta), \qquad x \notin S.$$

Note, if $S = \{\theta\}$ then it was previously understood² that

$$H_S(x) = |x - \theta|^{\alpha - d}, \quad x \notin S.$$

So it is still the case for a general S that

$$\mathbb{P}_{x}^{S}(A) = \int_{S} \mathbb{P}_{x}^{\{\theta\}}(A) \frac{|x - \theta|^{\alpha - d} \sigma_{1}(\mathrm{d}\,\theta)}{\int_{S} |x - \vartheta|^{\alpha - d} \sigma_{1}(\mathrm{d}\,\vartheta)}.$$

"pick a target uniformly in S with the terminal strike distribution and condition to hit it."

²K. Rivero, Statitkanitkul 2019

Conditioning to continuously hit $S \subseteq \mathbb{S}^{d-1}$ from either side

Theorem

Let $S \subset \mathbb{S}^{d-1}$ be a closed subset such that $\sigma_1(S) > 0$.

(i) Suppose $\alpha \in (0,1)$. For $x \notin S$,

$$\lim_{\varepsilon \to 0} \varepsilon^{\alpha - 1} \mathbb{P}_x(\tau_{S_{\varepsilon}} < \infty) = 2^{1 - 2\alpha} \frac{\Gamma((d + \alpha - 2)/2)}{\pi^{d/2} \Gamma(1 - \alpha)} \frac{\Gamma((2 - \alpha)/2)}{\Gamma(2 - \alpha)} H_S(x).$$

(ii) When $\alpha = 1$, we have that, for $x \notin S$,

$$\lim_{\varepsilon \to 0} \; |\log \varepsilon| \, \mathbb{P}_x(\tau_{S_\varepsilon} < \infty) = \frac{\Gamma((d-1)/2)}{\pi^{(d-1)/2}} H_S(x).$$

HEURISTIC FOR PROOF OF THEOREM 2

- ► The potential of the isotropic stable process satisfies $\mathbb{E}\left[\int_0^\infty \mathbf{1}_{(X_t \in d\, y)}\,\mathrm{d}\,t\right] = |y|^{\alpha-d}$.
- Let μ_{ε} be a finite measure supported on S_{ε} , which is absolutely continuous with respect to Lebesgue measure ℓ_d with density m_{ε} and define its potential by

$$U\mu_{\varepsilon}(x) := \int_{S_{\varepsilon}} |x - y|^{\alpha - d} \mu_{\varepsilon}(\mathrm{d} y) = \mathbb{E}_{x} \left[\int_{0}^{\infty} m_{\varepsilon}(X_{t}) \, \mathrm{d} t \right] \qquad x \in \mathbb{R}^{d},$$

As $m_{\varepsilon}(y) = 0$ for all $y \notin S_{\varepsilon}$. As such, the Strong Markov Property tells us that

$$U\mu_{\varepsilon}(x) = \mathbb{E}_{x} \left[\mathbf{1}_{\{\tau_{S_{\varepsilon}} < \infty\}} \int_{\tau_{S_{\varepsilon}}}^{\infty} m_{\varepsilon}(X_{t}) \, \mathrm{d} \, t \right] = \mathbb{E}_{x} \left[U\mu_{\varepsilon}(X_{\tau_{\varepsilon}}) \mathbf{1}_{\{\tau_{S_{\varepsilon}} < \infty\}} \right], \qquad x \notin S_{\varepsilon}.$$
(2)

Note, the above equality is also true when $x \in S_{\varepsilon}$ as, in that case, $\tau_{S_{\varepsilon}} = 0$.

Let us now suppose that μ_{ε} can be chosen in such a away that, for all $x \in S_{\varepsilon}$, $U\mu(x)=1$. Then

$$\mathbb{P}_x(\tau_{\varepsilon} < \infty) = U\mu_{\varepsilon}(x), \qquad x \notin S_{\varepsilon}.$$

 \triangleright Strategy: 'guess' the measure, μ_{ε} , by verifying

$$U\mu_{\varepsilon}(x) = 1 + o(1), \quad x \in S_{\varepsilon} \text{ as } \varepsilon \to 0,$$

so that

$$(1+o(1))\mathbb{P}_x(\tau_{S_{\varepsilon}}<\infty)=U\mu_{\varepsilon}(x), \qquad x\not\in S_{\varepsilon},$$

Draw out the the leading order decay in ε from $U\mu_{\varepsilon}(x)$.

HEURISTIC FOR PROOF OF THEOREM 2: FLAT EARTH THEORY

- ▶ Believing in a flat Earth is helpful
- In one dimension, it is known³ that for a one-dimensional symmetric stable process,

$$\int_{-1}^{1} |x - y|^{\alpha - 1} (1 - y)^{-\alpha/2} (1 + y)^{-\alpha/2} \, \mathrm{d} y = 1, \qquad x \in [-1, 1].$$

- ▶ Writing $X = |X| \arg(X)$, when X begins in the neighbourhood of S, then |X| begins in the neighbourhood of 1 and $\arg(X)$, essentially, from within S.
- ► Flat earth theory would imply

$$\mu_{\varepsilon}(\mathrm{d} y) = m_{\varepsilon}(y)\ell_d(\mathrm{d} y)\mathbf{1}_{(y \in S_{\varepsilon})},$$
with $m_{\varepsilon}(y) = c_{\alpha,d}(|y| - (1 - \varepsilon))^{-\alpha/2}(1 + \varepsilon - |y|)^{-\alpha/2}$

where ℓ_d is d -dimensional Lebesgue measure and $c_{\alpha,d,\varepsilon}$ is a constant to be determined so that

$$U\mu_{\varepsilon}(x) = 1 + o(1)$$
 $x \in S_{\varepsilon}$

The asymptotic does not depend on S

So far we are guessing:

$$\mu_{\varepsilon}(\mathrm{d}\,y) = m_{\varepsilon}(y)\ell_d(\mathrm{d}\,y)\mathbf{1}_{(y\in S_{\varepsilon})},$$
 with $m_{\varepsilon}(y) = c_{\alpha,d}(|y| - (1-\varepsilon))^{-\alpha/2}(1+\varepsilon - |y|)^{-\alpha/2}$

where ℓ_d is d -dimensional Lebesgue measure and $c_{\alpha,d,\varepsilon}$ is a constant to be determined so that

$$U\mu_{\varepsilon}(x) = 1 + o(1)$$
 $x \in S_{\varepsilon}$

• We don't think that the restriction to S_{ε} is important so we are going to write

$$\mu_{\varepsilon}(\mathrm{d}\,y) = \mu_{\varepsilon}^{(1)}(\mathrm{d}\,y) - \mu_{\varepsilon}^{(2)}(\mathrm{d}\,y)$$
 with
$$\mu^{(1)}(\mathrm{d}\,y) = m_{\varepsilon}(y)\ell_d(\mathrm{d}\,y) \quad \text{and} \quad \mu_{\varepsilon}^{(2)}(\mathrm{d}\,y) = \mathbf{1}_{(y \in \mathbb{S}_{\varepsilon}^{d-1} \setminus \mathbb{S}_{\varepsilon})} m_{\varepsilon}(y)\ell_d(\mathrm{d}\,y)$$

where $\mathbb{S}_{\varepsilon}^{d-1} = \{x \in \mathbb{R}^d : 1 - \varepsilon \le |x| \le 1 + \varepsilon\}.$

NASTY CALCULATIONS: $\alpha \in (0,1)$ For $x \in \mathbb{S}_{\varepsilon}^{d-1}$,

$$\begin{split} &U\mu_{\varepsilon}^{(1)}(x) \\ &= c_{\alpha,d} \int_{\mathbb{S}_{\varepsilon}^{d-1}} |x-y|^{\alpha-d} (|y|-(1-\varepsilon))^{-\alpha/2} (1+\varepsilon-|y|)^{-\alpha/2} \ell_d(\mathrm{d}y) \\ &= \frac{2c_{\alpha,d} \pi^{(d-1)/2}}{\Gamma((d-1)/2)} \int_{1-\varepsilon}^{1+\varepsilon} \frac{r^{d-1}}{(r-(1-\varepsilon))^{\alpha/2} (1+\varepsilon-r)^{\alpha/2}} \, \mathrm{d}r \int_{0}^{\pi} \frac{\sin^{d-2}\theta \, \mathrm{d}\theta}{(|x|^2-2|x|r\cos\theta+r^2)^{(d-\alpha)/2}} \\ &= \frac{2c_{\alpha,d} \pi^{d/2}}{\Gamma(d/2)} |x|^{\alpha-d} \int_{1-\varepsilon}^{|x|} \frac{2F_1 \left(\frac{d-\alpha}{2},1-\frac{\alpha}{2};\frac{d}{2};(r/|x|)^2\right) r^{d-1}}{(r-(1-\varepsilon))^{\alpha/2} (1+\varepsilon-r)^{\alpha/2}} \, \mathrm{d}r \\ &\qquad \qquad + \frac{2c_{\alpha,d} \pi^{d/2}}{\Gamma(d/2)} \int_{|x|}^{1+\varepsilon} \frac{2F_1 \left(\frac{d-\alpha}{2},1-\frac{\alpha}{2};\frac{d}{2};(|x|/r)^2\right) r^{\alpha-1}}{(r-(1-\varepsilon))^{\alpha/2} (1+\varepsilon-r)^{\alpha/2}} \, \mathrm{d}r \\ &= \frac{2c_{\alpha,d} \pi^{d/2}}{\Gamma(d/2)} \int_{\frac{1-\varepsilon}{|x|}}^{1} \frac{2F_1 \left(\frac{d-\alpha}{2},1-\frac{\alpha}{2};\frac{d}{2};r^2\right) r^{d-1}}{\left(r-\frac{1-\varepsilon}{|x|}\right)^{\alpha/2} \left(\frac{1+\varepsilon}{|x|}-r\right)^{\alpha/2}} \, \mathrm{d}r \\ &\qquad \qquad + \frac{2c_{\alpha,d} \pi^{d/2}}{\Gamma(d/2)} \int_{1}^{\frac{1+\varepsilon}{|x|}} \frac{2F_1 \left(\frac{d-\alpha}{2},1-\frac{\alpha}{2};\frac{d}{2};r^{-2}\right) r^{\alpha-1}}{\left(r-\frac{1-\varepsilon}{|x|}\right)^{\alpha/2} \left(\frac{1+\varepsilon}{|x|}-r\right)^{\alpha/2}} \, \mathrm{d}r \\ &= \cdots \cdots = 1+o(1) \end{split}$$

If we choose

$$c_{\alpha,d} = \frac{\Gamma((d+\alpha-2)/2)}{2^{\alpha}\pi^{d/2}\Gamma(1-\alpha)\Gamma((2-\alpha)/2)}$$

THE SAME CONCEPT WORKS WITH A PLANE

Theorem

Suppose that $\alpha \in (0,1]$ and the closed and bounded set $S \subseteq \mathbb{H}^{d-1}$ is such that $0 < \ell_{d-1}(S) < \infty$, where we recall that ℓ_{d-1} is (d-1)-dimensional Lebesgue measure.

(i) Suppose $\alpha \in (0,1)$. For $x \notin S$,

$$\lim_{\varepsilon \to 0} \varepsilon^{\alpha - 1} \mathbb{P}_{x}(\tau_{S_{\varepsilon}} < \infty) = 2^{1 - \alpha} \pi^{-(d - 2)/2} \frac{\Gamma(\frac{d - 2}{2})\Gamma(\frac{d - \alpha}{2})\Gamma(\frac{2 - \alpha}{2})^{2}}{\Gamma(\frac{1 - \alpha}{2})\Gamma(\frac{d - 1}{2})\Gamma(2 - \alpha)} K_{S}(x), \tag{3}$$

where

$$K_S(x) = \int_S |x - y|^{\alpha - d} \ell_{d-1}(\mathrm{d} y), \quad x \notin S.$$

(ii) Suppose $\alpha = 1$. For $x \notin S$.

$$\lim_{\varepsilon \to 0} |\log \varepsilon| \, \mathbb{P}_x(\tau_{S_{\varepsilon}} < \infty) = \frac{\Gamma(\frac{d-2}{2})}{\pi^{(d-2)/2}} K_S(x), \tag{4}$$

(iii) The process (X, \mathbb{P}^S) is well defined such that

$$\frac{d \mathbb{P}_{x}^{S}}{d \mathbb{P}_{x}} \Big|_{\mathcal{F}_{x}} = \frac{K_{S}(X_{t})}{K_{S}(x)}, \quad t \geq 0, x \notin S.$$
(5)

4 D > 4 P > 4 E > 4 E > 9 Q P

FLAT EARTH VS ROUND EARTH THEORY

- ▶ Consider the case $\alpha \in (0,1)$.
- Recall for conditioning a continuous approach to the patch on the sphere from outside we had a scaling with index αd :

$$\lim_{\varepsilon \to 0} \varepsilon^{\alpha - d} \mathbb{P}_{x}(X_{\underline{G}(\infty)} \in A_{\varepsilon}) = c_{\alpha, d} \int_{S} (|x|^{2} - 1)^{\alpha/2} |x - \theta|^{-d} \sigma_{1}(\mathrm{d}\,\theta),$$

▶ Where conditioning a continuous approach to the patch from either side, we had scaling index $\alpha - 1$:

$$\lim_{\varepsilon \to 0} \varepsilon^{\alpha - 1} \mathbb{P}_x(\tau_{S_{\varepsilon}} < \infty) = 2^{1 - 2\alpha} \frac{\Gamma((d + \alpha - 2)/2)}{\pi^{d/2} \Gamma(1 - \alpha)} \frac{\Gamma((2 - \alpha)/2)}{\Gamma(2 - \alpha)} H_S(x).$$

▶ In the first case, the conditioned path needs to be observant of the entire sphere. In the second case the conditioned path needs only a localised consideration of *S*, which appears flat in close proximity.

20/21

Thank you!
