Asymptotic moments of spatial branching processes

Andreas Kyprianou (University of Bath) Joint work with: Emma Horton (INRIA, Bordeaux) Isaac Gonzalez (University of Bath)

(P, G)-BRANCHING MARKOV PROCESS

- Particles will live in *E* a Lusin space (e.g. a Polish space would be enough)
- Let $P = (P_t, t \ge 0)$ be a semigroup on E.
- Write $B^+(E)$ for non-negative bounded measurable functions on E
- Particles evolve independently according to a P-Markov process.
- In an event which we refer to as 'branching', particles positioned at x die at rate $\beta \in B^+(E)$ and instantaneously, new particles are created in E according to a point process.
- The configurations of these offspring are described by the random counting measure

$$\mathcal{Z}(A) = \sum_{i=1}^{N} \delta_{x_i}(A),$$

with probabilities \mathcal{P}_x , where $x \in E$ is the position of death of the parent.

- Without loss of generality we can assume that $\mathcal{P}_x(N=1)=0$. On the other hand, we do allow for the possibility that $\mathcal{P}_x(N=0)>0$ for some or all $x\in E$.
- Henceforth we refer to this spatial branching process as a (P, G)-branching Markov process.

(P, G)-BRANCHING MARKOV PROCESS

• Define the so-called branching mechanism

$$G[f](x) := \beta(x)\mathcal{E}_x\left[\prod_{i=1}^N f(x_i) - f(x)\right], \qquad x \in E,$$

where we recall $f \in B_1^+(E) := \{ f \in B^+(E) : \sup_{x \in E} f(x) \le 1 \}.$

• Configuration of particles at time t is denoted by $\{x_1(t), \ldots, x_{N_t}(t)\}$ and, on the event that the process has not become extinct or exploded,

$$X_t(\cdot) = \sum_{i=1}^{N_t} \delta_{x_i(t)}(\cdot), \qquad t \ge 0.$$

is Markovian in N(E), the space of integer atomic measures.

- Its probabilities will be denoted $\mathbb{P} := (\mathbb{P}_{\mu}, \mu \in N(E)).$
- Define,

$$v_t[f](x) = \mathbb{E}_{\delta_x} \left[\prod_{i=1}^{N_t} f(x_i(t)) \right], \qquad f \in B_1^+(E), t \ge 0.$$

• Non-linear evolution semigroup

$$v_t[f](x) = \hat{P}_t[f](x) + \int_0^t P_s[G[v_{t-s}[f]]](x) ds, \quad t \ge 0.$$

k-TH MOMENT

 Our main results concern understanding the growth of the k-th moment functional in time

$$\mathbf{T}_t^{(k)}[f](x) := \mathbb{E}_{\delta_x}[\langle f, X_t \rangle^k], \qquad x \in E, f \in B^+(E), k \ge 1, t \ge 0.$$

- **Notational convenience**: Write T_t in place of $T_t^{(1)}$
- Related historical work: A number of papers have opened the topic of moments for branching particle systems and superprocesses, including e.g.:
 - \circ E. Dumonteil and A. Mazzolo. Residence times of branching diffusion processes. Phys. Rev. E, 94:012131, 2016.
 - o J. Fleischman. Limiting distributions for branching random fields. *Trans. Amer. Math. Soc.*, 239:353–389, 1978.
 - ∘ I. Iscoe. On the supports of measure-valued critical branching Brownian motion. *Ann. Probab.*, 16(1):200–221, 1988.
 - \circ A. Klenke. Multiple scale analysis of clusters in spatial branching models.
 - Ann. Probab., 25(4):1670-1711, 1997.
- Our objective: to show that for k ≥ 2 and any positive bounded measurable function f on E,

$$\lim_{t\to\infty} g(t)\mathbb{E}_{\delta_x}[\langle f, X_t \rangle^k] = C_k(x,f)$$

where the constant $C_k(x, f)$ can be identified explicitly.

• We need two fundamental assumptions.

ASSUMPTION (H1): ASMUSSEN-HERING CLASS

There exists an eigenvalue $\lambda \in \mathbb{R}$ and a corresponding right eigenfunction $\varphi \in B^+(E)$ and finite left eigenmeasure $\tilde{\varphi}$ such that, for $f \in B^+(E)$,

$$\langle T_t[\varphi], \mu \rangle = e^{\lambda t} \langle \varphi, \mu \rangle \text{ and } \langle T_t[f], \tilde{\varphi} \rangle = e^{\lambda t} \langle f, \tilde{\varphi} \rangle,$$

for all $\mu \in N(E)$ if (X, \mathbb{P}) is a branching Markov process (resp. a superprocess). Further let us define

$$\Delta_t = \sup_{x \in E, f \in B_1^+(E)} |\varphi(x)|^{-1} e^{-\lambda t} \mathrm{T}_t[f](x) - \langle \tilde{\varphi}, f \rangle|, \qquad t \ge 0.$$

We suppose that

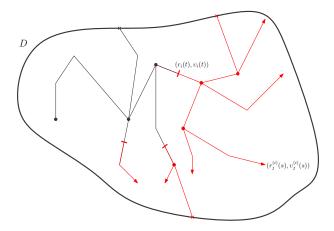

$$\sup_{t\geq 0} \Delta_t < \infty \text{ and } \lim_{t\to \infty} \Delta_t = 0.$$

NOTE: This assumption allows us to talk about criticality of the (P, G)-BMP:

$$\lambda = 0$$
 (critical) $|\lambda| > 0$ (supercritical) $|\lambda| < 0$ (subcritical)

WHO LIVES IN THE ASMUSSEN-HERING CLASS?

- Multi-type continuous Galton-Watson processes with a finite number of types.
- BBM in a bounded domain
- Neutron Branching process in a Bounded domain

Assumption $(H2)_k$

 $\sup_{x\in E} \mathcal{E}_x(\langle 1,\mathcal{Z}\rangle^k) < \infty.$

Theorem: The critical case $(\lambda = 0)$

Suppose that (H1) holds along with (H2)_k for some $k \ge 2$ and $\lambda = 0$. Define

$$\Delta_t^{(\ell)} = \sup_{\boldsymbol{x} \in E, ||f|| \leq 1} \left| t^{-(\ell-1)} \varphi(\boldsymbol{x})^{-1} \mathbf{T}_t^{(\ell)} [f](\boldsymbol{x}) - 2^{-(\ell-1)} \ell! \, \langle f, \tilde{\varphi} \rangle^{\ell} \langle \mathbb{V}[\varphi], \tilde{\varphi} \rangle^{\ell-1} \right|,$$

where

$$\mathbb{V}[\varphi](x) = \beta(x)\mathcal{E}_x\left(\langle \varphi, \mathcal{Z} \rangle^2 - \langle \varphi^2, \mathcal{Z} \rangle\right).$$

Then, for all $\ell \leq k$

$$\sup_{t\geq 0} \Delta_t^{(\ell)} < \infty \text{ and } \lim_{t\to \infty} \Delta_t^{(\ell)} = 0.$$

In short, subject to (H1) at criticality and (H2)_k, we have, for $f \in B_1^+(E)$,

$$\lim_{t\to\infty} t^{-(k-1)} \mathbb{E}_{\delta_x} \left[\langle f, X_t \rangle^k \right] = 2^{-(k-1)} \ell! \, \langle f, \tilde{\varphi} \rangle^k \langle \mathbb{V}[\varphi], \tilde{\varphi} \rangle^{k-1} \varphi(x)$$

"At criticality the k-th moment scales like t^{k-1} "

IDEAS FROM THE PROOF

• The obvious starting point:

$$\mathsf{T}^{(k)}[f](x) = (-1)^k \frac{\partial}{\partial \theta} \mathbb{E}_{\delta_x} [\mathsf{e}^{-\theta \langle f, X_t \rangle}] \bigg|_{\theta = 0}$$

Recall that

$$v_t[f](x) = \mathbb{E}_{\delta_x} \left[\prod_{i=1}^{N_t} f(x_i(t)) \right], \qquad f \in B_1^+(E), t \ge 0.$$

Non-linear evolution semigroup

$$v_t[f](x) = \hat{P}_t[f](x) + \int_0^t P_s[G[v_{t-s}[f]]](x)ds, \qquad t \ge 0.$$

Hence

$$v_t[e^{-\theta f}](x) = \mathbb{E}_{\delta_x}[e^{-\theta \langle f, X_t \rangle}]$$

• We need a new representation of the non-linear semigroup $(v_t, t > 0)$ which connects us to the assumption (H1).

LINEAR TO NON-LINEAR SEMIGROUP

Recall

$$T_t[f](x) = T_t^{(1)}[f](x) = \mathbb{E}_{\delta_x}[\langle f, X_t \rangle], \qquad t \ge 0, f \in B_1^+(E), x \in E.$$

• For $f \in B^+(E)$, it is well known that the mean semigroup evolution satisfies

$$T_t[f](x) = P_t[f] + \int_0^t P_s\left[FT_{t-s}[f]\right](x) ds \qquad t \ge 0, x \in E, \tag{1}$$

where

$$\mathbb{F}[f](x) = \beta(x)\mathcal{E}_x \left[\sum_{i=1}^N f(x_i) - f(x) \right] =: \beta(x)(\mathbb{m}[f](x) - f(x)), \qquad x \in E.$$

LINEAR TO NON-LINEAR SEMIGROUP

We now define a variant of the non-linear evolution semigroup equation

$$u_t[f](x) = \mathbb{E}_{\delta_x} \left[1 - \prod_{i=1}^{N_t} f(x_i(t)) \right], \quad t \ge 0, \ x \in E, f \in B_1^+(E).$$

For $f \in B_1^+(E)$, define

$$\mathbf{A}[f](x) = \beta(x)\mathcal{E}_x\left[\prod_{i=1}^N(1-f(x_i))-1+\sum_{i=1}^Nf(x_i)\right], \qquad x \in E.$$

$$v_t[f](x) = \hat{\mathbb{P}}_t[f](x) + \int_0^t \mathbb{P}_s\left[\mathbb{G}[v_{t-s}[f]]\right](x) ds \quad \text{and} \quad \mathbb{T}_t[f](x) = \mathbb{P}_t[f] + \int_0^t \mathbb{P}_s\left[\mathbb{F}\mathbb{T}_{t-s}[f]\right](x) ds$$
 gives us.....

Lemma

For all $g \in B_1^+(E)$, $x \in E$ and $t \ge 0$, the non-linear semigroup $u_t[g](x)$ satisfies

$$u_t[g](x) = T_t[1-g](x) - \int_0^t T_s \left[A[u_{t-s}[g]] \right](x) ds.$$

NONLINEAR TO K-TH MOMENT EVOLUTION EQUATION

In terms of our new semigroup equation:

$$\mathbb{T}_t^{(k)}[f](x) = (-1)^{k+1} \frac{\partial^k}{\partial \theta^k} \mathbb{u}_t[e^{-\theta f}](x) \bigg|_{\theta=0}.$$

Theorem

Fix $k \ge 2$. Assuming (H1) and (H2)_k, with the additional assumption that

$$\sup_{x \in E, s \le t} T_s^{(\ell)}[f](x) < \infty, \qquad \ell \le k - 1, f \in B^+(E), t \ge 0, \tag{2}$$

it holds that

$$T_t^{(k)}[f](x) = T_t[f^k](x) + \int_0^t T_s \left[\beta \eta_{t-s}^{(k-1)}[f]\right](x) \, \mathrm{d}s, \qquad t \ge 0, \tag{3}$$

where

$$\eta_{t-s}^{(k-1)}[f](x) = \mathcal{E}_x \left[\sum_{[k_1, \dots, k_N]_k^2} \binom{k}{k_1, \dots, k_N} \prod_{j=1}^N \mathbb{T}_{t-s}^{(k_j)}[f](x_j) \right],$$

and $[k_1, \ldots, k_N]_k^2$ is the set of all non-negative N-tuples (k_1, \ldots, k_N) such that $\sum_{i=1}^N k_i = k$ and at least two of the k_i are strictly positive.

INDUCTION: $k \mapsto k+1$

- Suppose the result is true for the first *k* moments.
- Recall $T_t[f](x) \to \langle f, \tilde{\varphi} \rangle \varphi(x)$ so that, for $k \ge 2$,

$$\lim_{t\to\infty} t^{-k} \mathrm{T}_t[f^{k+1}](x) \to 0$$

• Hence: $\lim_{t \to \infty} t^{-k} \mathbf{T}_t^{(k+1)}[f](x)$

$$\begin{split} &= \lim_{t \to \infty} t^{-k} \int_0^t \mathbb{T}_s \left[\mathcal{E} \cdot \left[\sum_{[k_1, \dots, k_N]_{k+1}^2} \binom{k+1}{k_1, \dots, k_N} \prod_{j=1}^N \mathbb{T}_{t-s}^{(k_j)}[f](x_j) \right] \right] (x) ds \\ &= \lim_{t \to \infty} t^{-(k-1)} \int_0^1 \mathbb{T}_{ut} \left[\mathcal{E} \cdot \left[\sum_{[k_1, \dots, k_N]_{k+1}^2} \binom{k+1}{k_1, \dots, k_N} \prod_{j=1}^N \mathbb{T}_{t(1-u)}^{(k_j)}[f](x_j) \right] \right] (x) du \\ &= \lim_{t \to \infty} \int_0^1 \mathbb{T}_{ut} \left[\mathcal{E} \cdot \left[\sum_{[k_1, \dots, k_N]_{k+1}^2} \binom{k+1}{k_1, \dots, k_N} \frac{(t(1-u))^{k+1-\#\{j: k_j > 0\}}}{t^{k-1}} \prod_{j=1}^N \frac{\mathbb{T}_{t(1-u)}^{(k_j)}[f](x_j)}{(t(1-u))^{k_j-1}} \right] \right] (x) du \end{split}$$

Rough outline of the induction: $k \mapsto k+1$

• From the last slide:

$$\lim_{t\to\infty} t^{-k} \mathsf{T}_t^{(k+1)}[f](x)$$

$$= \lim_{t \to \infty} \int_0^1 \mathbf{T}_{ut} \left[\mathcal{E} \cdot \left[\sum_{[k_1, \dots, k_N]_{k+1}^2} {k+1 \choose k_1, \dots, k_N} \frac{(t(1-u))^{k+1-\#\{j: k_j > 0\}}}{t^{k-1}} \prod_{j=1}^N \frac{\mathbf{T}_{t(1-u)}^{(k_j)}[f](x_j)}{(t(1-u))^{k_j-1}} \right] \right] (x) du$$

- Largest terms in blue correspond to those summands for which $\#\{j: k_i > 0\} = 2$
- The induction hypothesis plus $\sum_{i=1}^{N} k_j = k+1$ ensures that the product term is asymptotically a constant
- The simple identity

$$\sum_{[k_1, \dots, k_N]_{k+1}^2} {k+1 \choose k_1, \dots, k_N} \le N^{k+1}$$

shows us where the need for the hypothesis (H2) comes in.

• We need an ergodic limit theorem that reads (roughly): If

$$F(x,u) := \lim_{t \to \infty} F(x,u,t), \qquad x \in E, u \in [0,1],$$

"uniformly" for $(u, x) \in [0, 1] \times E$, then

$$\lim_{t\to\infty}\int_0^1 \mathbb{T}_{ut}[F(\cdot,u,t)](x)\mathrm{d}u = \int_0^1 \langle \tilde{\varphi}, F(\cdot,u)\rangle \mathrm{d}u$$

"uniformly" for $x \in E$.

THEOREM: SUPERCRITICAL ($\lambda > 0$)

Suppose that (H1) holds along with (H2)_k for some $k \ge 2$ and $\lambda > 0$. Redefine

$$\Delta_t^{(\ell)} = \sup_{x \in E, ||f|| < 1} \left| \varphi(x)^{-1} \mathrm{e}^{-\ell \lambda t} \mathrm{T}_t^{(\ell)}[f](x) - \ell! \langle f, \tilde{\varphi} \rangle^{\ell} L_{\ell} \right|,$$

where $L_1(x) = 1$ and we define iteratively for $k \ge 2$,

$$L_k = \frac{1}{\lambda(k-1)} \left\langle \tilde{\varphi}, \beta \mathcal{E}. \left[\sum_{[k_1, \dots, k_N]_k^2} \prod_{\substack{j=1 \ j: k_j > 0}}^N \varphi(x_j) L_{k_j} \right] \right\rangle.$$

Then, for all $\ell \leq k$

$$\sup_{t\geq 0} \Delta_t^{(\ell)} < \infty \text{ and } \lim_{t\to \infty} \Delta_t^{(\ell)} = 0.$$

"At subcriticality the *k*-th moment scales like $e^{\lambda kt}$ (i.e. the first moment to the power *k*)"

Theorem: Subcritical ($\lambda < 0$)

Suppose that (H1) holds along with (H2) for some $k \ge 2$ and $\lambda < 0$. Redefine

$$\Delta_t^{(\ell)} = \sup_{x \in E, ||f|| < 1} \left| \varphi(x)^{-1} \mathrm{e}^{-\lambda t} \mathbb{T}_t^{(\ell)}[f](x) - \ell! \langle f, \tilde{\varphi} \rangle^{\ell} L_{\ell} \right|,$$

where we define iteratively $L_1 = \langle f, \tilde{\varphi} \rangle$ and for $k \geq 2$,

$$L_k = \frac{\langle f^k, \tilde{\varphi} \rangle}{\langle f, \tilde{\varphi} \rangle^k k!} - \left\langle \beta \mathcal{E} \cdot \left[\sum_{n=2}^k \frac{1}{\lambda(n-1)} \sum_{[k_1, \dots, k_N]_k^n} \prod_{\substack{j=1 \ j: k_j > 0}}^N \varphi(x_j) L_{k_j} \right], \tilde{\varphi} \right\rangle.$$

Then, for all $\ell \leq k$

$$\sup_{t\geq 0} \Delta_t^{(\ell)} < \infty \text{ and } \lim_{t\to \infty} \Delta_t^{(\ell)} = 0.$$

"At subcriticality the k-th moment scales like $e^{\lambda t}$ (i.e. like the first moment)"

WHAT ABOUT THE OCCUPATION MEASURE?

• Let us define the running occupation of the branching particle system via

$$\int_0^t X_s(\cdot) ds, \qquad t \ge 0.$$

• What can we say about its moments?

$$\mathbb{M}_{t}^{(k)}[g](x) := \mathbb{E}_{\delta_{x}}\left[\left(\int_{0}^{t} \langle g, X_{s} \rangle \mathrm{d}s\right)^{k}\right], \qquad x \in E, g \in B^{+}(E), k \geq 1, t \geq 0.$$

• We know that the pair

$$\left(X_t, \int_0^t X_s \mathrm{d}s\right)$$

is Markovian and that its semigroup

$$\text{v}_t[f,g] = \mathbb{E}_{\delta_x} \left[e^{-\langle f, X_t \rangle - \int_0^t \langle g, X_s \rangle \; d \, s} \right], \qquad t \geq 0, \, x \in E, f,g \in B^+(E),$$

solves

$$v_t[f,g](x) = \hat{P}_t[e^{-f}](x) + \int_0^t P_s\left[G[v_{t-s}[f,g]) - gv_{t-s}[f,g]\right](x)ds.$$

PLAYING THE SAME GAME AS BEFORE

Define a variant of the non-linear evolution equation associated with $(X_t, \int_0^s X_s ds)$ via

$$\mathrm{u}_t[f,g](x) = \mathbb{E}_{\delta_x} \left[1 - \mathrm{e}^{-\langle f, X_t \rangle - \int_0^t \langle g, X_s \rangle \, \mathrm{d}\, s} \right], \qquad t \geq 0, \, x \in E, \, ||f|| < \infty, ||g|| < \infty.$$

For $f \in B_1^+(E)$, define

$$\mathbf{A}[f](x) = \beta(x)\mathcal{E}_x \left[\prod_{i=1}^N (1 - f(x_i)) - 1 + \sum_{i=1}^N f(x_i) \right], \qquad x \in E.$$

A re-arrangement of the joint semigroup of $(X_t, \int_0^t X_s ds)$ is captured by:

Lemma

For all $f,g \in B^+(E)$, $x \in E$ and $t \ge 0$, the non-linear semigroup $u_t[f,g](x)$ satisfies

$$\mathbf{u}_t[f,g](x) = \mathbf{T}_t[1 - \mathbf{e}^{-f}](x) - \int_0^t \mathbf{T}_s \left[\mathbf{A}[\mathbf{u}_{t-s}[f,g]] - g(1 - \mathbf{u}_{t-s}[f,g]) \right](x) ds.$$

Theorem: Critical case $(\lambda = 0)$

Suppose that (H1) holds along with (H2) for $k \geq 2$ and $\lambda = 0$. Define

$$\Delta_t^{(\ell)} = \sup_{\boldsymbol{x} \in E, ||\boldsymbol{g}|| \leq 1} \left| t^{-(2\ell-1)} \varphi(\boldsymbol{x})^{-1} \mathbf{M}_t^{(\ell)}[\boldsymbol{g}](\boldsymbol{x}) - 2^{-(\ell-1)} \ell! \, \langle \boldsymbol{g}, \tilde{\varphi} \rangle^{\ell} \langle \mathbb{V}[\varphi], \tilde{\varphi} \rangle^{\ell-1} L_{\ell} \right|,$$

where $L_1=1$ and L_k is defined through the recursion $L_k=(\sum_{i=1}^{k-1}L_iL_{k-i})/(2k-1)$. Then, for all $\ell \leq k$

$$\sup_{t\geq 0} \Delta_t^{(\ell)} < \infty \text{ and } \lim_{t\to \infty} \Delta_t^{(\ell)} = 0.$$

THEOREM: SUPERCRITICAL CASE ($\lambda > 0$)

Suppose that (H1) holds along with (H2) for some k > 2 and $\lambda > 0$. Redefine

$$\Delta_t^{(\ell)} = \sup_{x \in E, ||g|| \le 1} \left| \varphi(x)^{-1} \mathrm{e}^{-\ell \lambda t} \mathrm{M}_t^{(\ell)}[g](x) - \ell! \langle g, \tilde{\varphi} \rangle^{\ell} L_{\ell} \right|,$$

where $L_1 = 1/\lambda$ and for $k \ge 2$ we define iteratively,

$$L_k = \frac{1}{\lambda(k-1)} \left\langle \beta \mathcal{E} \left[\sum_{[k_1, \dots, k_N]_k^2} \prod_{\substack{j=1 \ j: k_j > 0}}^N \varphi(x_j) L_{k_j} \right], \tilde{\varphi} \right\rangle,$$

Then, for all $\ell < k$

$$\sup_{t\geq 0} \Delta_t^{(\ell)} < \infty \text{ and } \lim_{t\to \infty} \Delta_t^{(\ell)} = 0.$$

THEOREM: SUBCRITICAL CASE ($\lambda < 0$)

Suppose that (H1) holds along with (H2) for some $k \ge 2$ and $\lambda < 0$. Redefine

$$\Delta_t^{(\ell)} = \sup_{\boldsymbol{x} \in E, ||\boldsymbol{g}|| < 1} \left| \varphi(\boldsymbol{x})^{-1} \mathbf{M}_t^{(\ell)}[\boldsymbol{g}](\boldsymbol{x}) - \ell! \langle \boldsymbol{g}, \tilde{\varphi} \rangle^{\ell} L_{\ell} \right|,$$

where $|g| < \infty$, $L_1 = 1/|\lambda|$ and for $k \ge 2$, the constants L_k are defined recursively via

$$L_{k} = \frac{1}{|\lambda|} \left\langle \beta \mathcal{E} \left[\sum_{[k_{1}, \dots, k_{N}]_{k}^{2}} \prod_{\substack{j=1 \ j: k_{j} > 0}}^{N} \varphi(x_{j}) L_{k_{j}} \right], \tilde{\varphi} \right\rangle - \frac{\langle g \varphi, \tilde{\varphi} \rangle}{|\lambda| \langle g, \tilde{\varphi} \rangle} L_{k-1},$$

Then, for all $\ell \leq k$

$$\sup_{t>0} \Delta_t^{(\ell)} < \infty \text{ and } \lim_{t\to\infty} \Delta_t^{(\ell)} = 0.$$

WHAT ABOUT SUPERPROCESSES?

- A Markov process $X := (X_t : t \ge 0)$ on M(E), the space of finite measures on Lusin space E, with $\mathbb{P} := (\mathbb{P}_{\mu}, \mu \in M(E))$.
- Transition semigroup

$$\mathbb{E}_{\mu}\left[e^{-\langle f,X_{f}\rangle}\right] = e^{-\langle \mathbb{V}_{f}[f],\mu\rangle}, \qquad \mu \in M(E), f \in B^{+}(E),$$

where

$$\forall_t [f](x) = P_t[f](x) - \int_0^t P_s \left\langle \psi(\cdot, \forall_{t-s}[f](\cdot)) + \phi(\cdot, \forall_{t-s}[f]) \right|(x) ds.$$

ullet Here ψ denotes the local branching mechanism

$$\psi(x,\lambda) = -b(x)\lambda + c(x)\lambda^2 + \int_{(0,\infty)} \left(e^{-\lambda y} - 1 + \lambda y \right) \nu(x, dy), \quad \lambda \ge 0, \quad (4)$$

where $b \in B(E)$, $c \in B^+(E)$ and $(x \wedge x^2)\nu(x, \mathrm{d}y)$ is a bounded kernel from E to $(0, \infty)$, and ϕ is the non-local branching mechanism

$$\phi(x,f) = \beta(x)f(x) - \beta(x)\gamma(x,f) - \beta(x)\int_{M(E)^{\circ}} (1 - e^{-\langle f, \nu \rangle})\Gamma(x, d\nu),$$

where $\beta \in B^+(E)$, $\gamma(x,f)$ is a bounded function on $E \times B^+(E)$ and $\nu(1)\Gamma(x,d\nu)$ is a bounded kernel from E to $M(E)^\circ := M(E) \setminus \{0\}$ with

$$\gamma(x,f) + \int_{M(F)^{\circ}} \langle 1, \nu \rangle \Gamma(x, d\nu) \leq 1.$$

What about superprocesses?

Keep the same notation e.g.

$$T_t^{(k)}[f](x) := \mathbb{E}_{\delta_x}[\langle f, X_t \rangle^k], \qquad x \in E, f \in B^+(E), k \ge 1, t \ge 0.$$

• Under the same first ergodic moment assumption (H1) and (H2)_k replaced by

$$\sup_{x\in E}\left(\int_0^\infty |y|^k\nu(x,\mathrm{d}y)+\int_{M(E)^\circ}\langle 1,\nu\rangle^k\Gamma(x,\mathrm{d}\nu)\right)<\infty.$$

- A different proof is needed because we cannot work under the expectation with individual particles.
- Instead an approach using Faa di Bruno's formula can be used taking advantage of the smoother branching mechanism than in the particle setting.
- The same conclusions hold for the critical, supercritical and subcritical setting as for the branching particle setting, albeit the constants in the limit are slightly different.

Thank you!
