Extra questions for Chapter 3

1. The early parts of this question will help you do the later parts. Let $w = e^{2\pi i/3}$.
 - (a) Show that every complex number can be uniquely written as $a + bw$ with a, b real.
 - (b) Show that $w^2 + w + 1 = 0$ very easily, by considering $w^3 - 1$.
 - (c) If $z = a + bw$ with a, b real, let $M(z) = (a + bw)(a + bw^2)$. Show that $M(z)$ is real and that for all z_1, z_2 we have $M(z_1)M(z_2)$.
 - (d) Show that the triangle with sides 3, 5, 7 contains an angle of $2\pi/3$.
 - (e) Show that there are infinitely many pair-wise non-similar triangles with integral sides, and containing an angle of $2\pi/3$.
 - (f) Suppose that α is an angle occurring in a triangle with integral sides. Is it true that there are infinitely many pair-wise non-similar triangles with integral sides, and containing the angle α ?
