

Chapter 8.2

Credit rationing caused by moral hazard

Risk-taking by companies

Risk-taking by companies

- ▶ Companies can choose between investments with different risks

Risk-taking by companies

- ▶ Companies can choose between investments with different risks
- ▶ Banks seek to provide incentives to choose investments with **low risks**

Risk-taking by companies

- ▶ Companies can choose between investments with different risks
- ▶ Banks seek to provide incentives to choose investments with low risks
- ▶ They do so by setting **loan conditions**

Risk-taking by companies

- ▶ Companies can choose between investments with different risks
- ▶ Banks seek to provide incentives to choose investments with low risks
- ▶ They do so by setting loan conditions, the **loan rate**

Risk-taking by companies

- ▶ Companies can choose between investments with different risks
- ▶ Banks seek to provide incentives to choose investments with low risks
- ▶ They do so by setting loan conditions, the loan rate and the **loan size**

Risk-taking by companies

- ▶ Companies can choose between investments with different risks
- ▶ Banks seek to provide incentives to choose investments with low risks
- ▶ They do so by setting loan conditions, the loan rate and the loan size

Company profits

Company profits

- ▶ If **successful**, companies obtain their **return**
- ▶ $\Pi_C^i = \pi_i ((1 + R_i) L \quad)$

Company profits

- ▶ If **successful**, companies obtain their **return** and **repay the loan**
- ▶ $\Pi_C^i = \pi_i ((1 + R_i) L - (1 + r_L) L)$

Company profits

- ▶ If successful, companies obtain their return and repay the loan
- ▶ $\Pi_C^i = \pi_i ((1 + R_i) L - (1 + r_L) L)$
- ▶ Companies choose the low-risk investment if $\Pi_C^H \geq \Pi_C^L$

Company profits

- ▶ If successful, companies obtain their return and repay the loan
 - ▶ $\Pi_C^i = \pi_i ((1 + R_i) L - (1 + r_L) L)$
 - ▶ Companies choose the low-risk investment if $\Pi_C^H \geq \Pi_C^L$
- $\Rightarrow 1 + r_L \leq 1 + \hat{r}_L = \frac{\pi_H(1+R_H) - \pi_L(1+R_L)}{\pi_H - \pi_L}$

Company profits

- ▶ If successful, companies obtain their return and repay the loan
 - ▶ $\Pi_C^i = \pi_i ((1 + R_i) L - (1 + r_L) L)$
 - ▶ Companies choose the low-risk investment if $\Pi_C^H \geq \Pi_C^L$
- $\Rightarrow 1 + r_L \leq 1 + \hat{r}_L = \frac{\pi_H(1+R_H) - \pi_L(1+R_L)}{\pi_H - \pi_L}$

Bank profits

Bank profits

- ▶ Banks are repaid the loan if the company is successful
- ▶ $\Pi_B^i = \pi_i(1 + r_L) L$

Bank profits

- ▶ Banks are repaid the loan if the company is successful, and repay deposits
- ▶ $\Pi_B^i = \pi_i(1 + r_L) L - (1 + r_D) L$

Bank profits

- ▶ Banks are repaid the loan if the company is successful, and repay deposits
- ▶ $\Pi_B^i = \pi_i(1 + r_L) L - (1 + r_D) L$
- ▶ The success rate of the company will depend on the **loan rate** they charge

Bank profits

- ▶ Banks are repaid the loan if the company is successful, and repay deposits
- ▶ $\Pi_B^i = \pi_i(1 + r_L) L - (1 + r_D) L$
- ▶ The success rate of the company will depend on the loan rate they charge
- ▶ $\Pi_B = \begin{cases} \Pi_B^L & \text{if } r_L \leq \hat{r}_L \\ \Pi_B^H & \text{if } r_L > \hat{r}_L \end{cases}$

Bank profits

- ▶ Banks are repaid the loan if the company is successful, and repay deposits
- ▶ $\Pi_B^i = \pi_i(1 + r_L) L - (1 + r_D) L$
- ▶ The success rate of the company will depend on the loan rate they charge
- ▶ $\Pi_B = \begin{cases} \Pi_B^L & \text{if } r_L \leq \hat{r}_L \\ \Pi_B^H & \text{if } r_L > \hat{r}_L \end{cases}$
- ▶ Low loan rates will induce **low risks**

Bank profits

- ▶ Banks are repaid the loan if the company is successful, and repay deposits
- ▶ $\Pi_B^i = \pi_i(1 + r_L) L - (1 + r_D) L$
- ▶ The success rate of the company will depend on the loan rate they charge
- ▶ $\Pi_B = \begin{cases} \Pi_B^L & \text{if } r_L \leq \hat{r}_L \\ \Pi_B^H & \text{if } r_L > \hat{r}_L \end{cases}$
- ▶ Low loan rates will induce low risks and high loan rates **high risks**

Bank profits

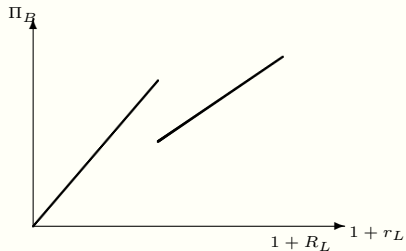

- ▶ Banks are repaid the loan if the company is successful, and repay deposits
- ▶ $\Pi_B^i = \pi_i(1 + r_L) L - (1 + r_D) L$
- ▶ The success rate of the company will depend on the loan rate they charge
- ▶ $\Pi_B = \begin{cases} \Pi_B^L & \text{if } r_L \leq \hat{r}_L \\ \Pi_B^H & \text{if } r_L > \hat{r}_L \end{cases}$
- ▶ Low loan rates will induce low risks and high loan rates high risks

Summary

Summary

- ▶ Banks do not increase loan rates **above a threshold** as this would induce companies to choose **high-risk investments**

Summary

- ▶ Banks do not increase loan rates above a threshold as this would induce companies to choose high-risk investments
- ▶ Banks **ration loans** as demand exceeds supply at this loan rate

Summary

- ▶ Banks do not increase loan rates above a threshold as this would induce companies to choose high-risk investments
- ▶ Banks ration loans as demand exceeds supply at this loan rate
- ⇒ Banks seeking **large loans** due to low loan rates may be rationed

Summary

- ▶ Banks do not increase loan rates above a threshold as this would induce companies to choose high-risk investments
- ▶ Banks ration loans as demand exceeds supply at this loan rate
- ⇒ Banks seeking large loans due to low loan rates may be rationed
