

Chapter 7.3.1

Preventing adverse selection

Uninformed investors making losses

- ▶ Informed investors will have high demand for securities that are underpriced and no demand for those that are overpriced
- ▶ Uninformed investors will receive few securities that are underpriced and a large allocation of those that are overpriced
- ▶ This causes adverse selection as uninformed investors know they will on average overpay

Willingness to pay

- ▶ Securities have value V_H with probability π and $V_L < V_H$ otherwise
- ▶ Informed investors buy at most \bar{Q} of the total Q securities
- ▶ Informed investors are willing to pay V_i for a security
- ▶ Uninformed investors are willing to pay the expected value $\hat{S} = \pi V_H + (1 - \pi) V_L$ for a security

Losses to uninformed investors

- ▶ As $\hat{S} > V_L$, uninformed investors submit higher bids and will obtain the entire issue if V_L is realised
- ▶ The profits are the difference between the value and the price paid for each security
- ▶ Profits: $\Pi_C^L = (V_L - \hat{S}) Q = -\pi (V_H - V_L) Q$
- ▶ The offer price is \hat{S} as all bids are at that level

Profits to uninformed investors

- ▶ As $\hat{S} < V_H$, uninformed investors submit lower bids and will obtain only $Q - \bar{Q}$ securities if V_H is realised
- ▶ The profits are the difference between the value and the price paid for each security
- ▶ Profits: $\Pi_C^H = (V_L - S) (\bar{Q} - Q)$
- ▶ The offer price can be any price below V_H

Participation of uninformed investors

- ▶ Expected profits of uninformed investors are $\Pi_C = \pi \Pi_D^H + (1 - \pi) \Pi_D^L$
- ▶ Uninformed investors only participate if $\Pi_C \geq 0$ or $S \leq S^* = V_H - (1 - \pi) (V_H - V_L) \frac{Q}{Q - \bar{Q}} \leq V_H$
- ▶ The issue is underpriced if the high value is realised
- ▶ Expected offer price: $E[S] = \pi S^* + (1 - \pi) \hat{S} \leq \hat{S}$
- ▶ On average the issue is underpriced

Effect of underpricing

- ▶ Underpricing allows uninformed investors to make profits in high-demand issues and offsets their losses in low-demand issues
- ▶ This inducement allows low-demand issues to be sold to uninformed investors at high prices
- ▶ The lower allocation for high-demand issues results in overall underpricing

Cross-subsidization

- ▶ Investment banks do not pay to ensure the issue is sold
- ▶ Issuers pay for the inducement of uninformed investors through underpricing
- ▶ The losses are to issuers with securities in high demand, those unaffected by the low demand
- ▶ It is a cross-subsidization of issuers with high-demand securities to those with low-demand securities
