

Chapter 18.1.1
Fixed-price deposit insurance

The effect on deposit rates

The effect on deposit rates

- ▶ Deposit insurance is often **unpriced**

The effect on deposit rates

- ▶ Deposit insurance is often unpriced or any charges are **fixed**

The effect on deposit rates

- ▶ Deposit insurance is often unpriced or any charges are fixed
- ▶ Deposit insurance eliminates the risk to **depositors**

The effect on deposit rates

- ▶ Deposit insurance is often unpriced or any charges are fixed
- ▶ Deposit insurance eliminates the risk to depositors, which would obtain **lower deposit rates**

The effect on deposit rates

- ▶ Deposit insurance is often unpriced or any charges are fixed
- ▶ Deposit insurance eliminates the risk to depositors, which would obtain lower deposit rates
- ▶ This will affect the **incentives of banks** when lending

The effect on deposit rates

- ▶ Deposit insurance is often unpriced or any charges are fixed
- ▶ Deposit insurance eliminates the risk to depositors, which would obtain lower deposit rates
- ▶ This will affect the incentives of banks when lending

Bank profits without deposit insurance

Bank profits without deposit insurance

- ▶ Banks obtain the repayment of loans
- ▶ $\Pi_B = \pi (1 + r_L) L$

Bank profits without deposit insurance

- ▶ Banks obtain the **repayment of loans** and in turn **repay their depositors**
- ▶ $\Pi_B = \pi (1 + r_L) L - (1 + r_D) D$

Bank profits without deposit insurance

- ▶ Banks obtain the **repayment of loans** and in turn **repay their depositors** and **equity owners**
- ▶ $\Pi_B = \pi (1 + r_L) L - (1 + r_D) D - E$

Bank profits without deposit insurance

- ▶ Banks obtain the repayment of loans and in turn repay their depositors and equity owners
- ▶ $\Pi_B = \pi (1 + r_L) L - (1 + r_D) D - E$
- ▶ In competitive markets, banks make no profits: $\Pi_B = 0$

Bank profits without deposit insurance

- ▶ Banks obtain the repayment of loans and in turn repay their depositors and equity owners
 - ▶ $\Pi_B = \pi (1 + r_L) L - (1 + r_D) D - E$
 - ▶ In competitive markets, banks make no profits: $\Pi_B = 0$
- $\Rightarrow 1 + r_L = \frac{(1+r_D)D+E}{\pi(D+E)}$

Bank profits without deposit insurance

- ▶ Banks obtain the repayment of loans and in turn repay their depositors and equity owners
 - ▶ $\Pi_B = \pi (1 + r_L) L - (1 + r_D) D - E$
 - ▶ In competitive markets, banks make no profits: $\Pi_B = 0$
- $\Rightarrow 1 + r_L = \frac{(1+r_D)D+E}{\pi(D+E)}$

Maximizing risks

Maximizing risks

- ▶ With deposit insurance, banks have to pay the insurance premium
- ▶ $\hat{\Pi}_B = \pi ((1 + r_L) L - (1 + r_D) D) - P - E$

Maximizing risks

- ▶ With deposit insurance, banks have to pay the insurance premium
- ▶ $\hat{\Pi}_B = \pi ((1 + r_L) L - (1 + r_D) D) - P - E$
- ▶ Assume loan rates are set competitively as **without deposit insurance**

Maximizing risks

- ▶ With deposit insurance, banks have to pay the insurance premium
 - ▶ $\hat{\Pi}_B = \pi ((1 + r_L) L - (1 + r_D) D) - P - E$
 - ▶ Assume loan rates are set competitively as without deposit insurance
- $\Rightarrow \hat{\Pi}_B = (1 - \pi) (1 + r_D) D - P$

Maximizing risks

- ▶ With deposit insurance, banks have to pay the insurance premium
- ▶ $\hat{\Pi}_B = \pi ((1 + r_L) L - (1 + r_D) D) - P - E$
- ▶ Assume loan rates are set competitively as without deposit insurance

$$\begin{aligned}\Rightarrow \hat{\Pi}_B &= (1 - \pi) (1 + r_D) D - P \\ &= (1 - \pi) (1 + r_D) \frac{1}{1 + \kappa} L - P\end{aligned}$$

Maximizing risks

- ▶ With deposit insurance, banks have to pay the insurance premium
 - ▶ $\hat{\Pi}_B = \pi ((1 + r_L) L - (1 + r_D) D) - P - E$
 - ▶ Assume loan rates are set competitively as without deposit insurance
- $$\Rightarrow \hat{\Pi}_B = (1 - \pi) (1 + r_D) D - P$$
- $$= (1 - \pi) (1 + r_D) \frac{1}{1+\kappa} L - P$$
- ▶ Bank profits are maximized if **loan risks are maximized**

Maximizing risks

- ▶ With deposit insurance, banks have to pay the insurance premium
 - ▶ $\hat{\Pi}_B = \pi ((1 + r_L) L - (1 + r_D) D) - P - E$
 - ▶ Assume loan rates are set competitively as without deposit insurance
- $$\Rightarrow \hat{\Pi}_B = (1 - \pi) (1 + r_D) D - P$$
- $$= (1 - \pi) (1 + r_D) \frac{1}{1+\kappa} L - P$$
- ▶ Bank profits are maximized if loan risks are maximized and **leverage is maximized**

Maximizing risks

- ▶ With deposit insurance, banks have to pay the insurance premium
 - ▶ $\hat{\Pi}_B = \pi ((1 + r_L) L - (1 + r_D) D) - P - E$
 - ▶ Assume loan rates are set competitively as without deposit insurance
- $$\Rightarrow \hat{\Pi}_B = (1 - \pi) (1 + r_D) D - P$$
- $$= (1 - \pi) (1 + r_D) \frac{1}{1+\kappa} L - P$$
- ▶ Bank profits are maximized if loan risks are maximized and leverage is maximized

Optimal deposit insurance pricing

Optimal deposit insurance pricing

- ▶ Deposit insurance premia should take into account the **risks of banks**

Optimal deposit insurance pricing

- ▶ Deposit insurance premia should take into account the risks of banks
- ▶ Set premium such that $\hat{\Pi}_B = 0$

Optimal deposit insurance pricing

- ▶ Deposit insurance premia should take into account the risks of banks
- ▶ Set premium such that $\hat{\Pi}_B = 0$

$$\Rightarrow P = (1 - \pi) (1 + r_D) \frac{1}{1 + \kappa} L$$

Optimal deposit insurance pricing

- ▶ Deposit insurance premia should take into account the risks of banks
 - ▶ Set premium such that $\hat{\Pi}_B = 0$
- $\Rightarrow P = (1 - \pi) (1 + r_D) \frac{1}{1+\kappa} L$
- ▶ The premium is **increasing in loan risks**

Optimal deposit insurance pricing

- ▶ Deposit insurance premia should take into account the risks of banks
 - ▶ Set premium such that $\hat{\Pi}_B = 0$
- $\Rightarrow P = (1 - \pi) (1 + r_D) \frac{1}{1+\kappa} L$
- ▶ The premium is increasing in loan risks and **bank leverage**

Optimal deposit insurance pricing

- ▶ Deposit insurance premia should take into account the risks of banks
 - ▶ Set premium such that $\hat{\Pi}_B = 0$
- $\Rightarrow P = (1 - \pi) (1 + r_D) \frac{1}{1+\kappa} L$
- ▶ The premium is increasing in loan risks and bank leverage
 - ▶ This would provide **no incentive** to increase risks

Optimal deposit insurance pricing

- ▶ Deposit insurance premia should take into account the risks of banks
 - ▶ Set premium such that $\hat{\Pi}_B = 0$
- $\Rightarrow P = (1 - \pi) (1 + r_D) \frac{1}{1+\kappa} L$
- ▶ The premium is increasing in loan risks and bank leverage
 - ▶ This would provide no incentive to increase risks

Summary

Summary

- ▶ Deposit insurance premia that do not take into account the risks banks take, provide **incentives to increase risks**

Summary

- ▶ Deposit insurance premia that do not take into account the risks banks take, provide incentives to increase risks
- ▶ Deposit insurance causes **moral hazard** as any losses to depositors are covered

Summary

- ▶ Deposit insurance premia that do not take into account the risks banks take, provide incentives to increase risks
- ▶ Deposit insurance causes moral hazard as any losses to depositors are covered, allowing them to be **unresponsive** to bank risks

Summary

- ▶ Deposit insurance premia that do not take into account the risks banks take, provide incentives to increase risks
- ▶ Deposit insurance causes moral hazard as any losses to depositors are covered, allowing them to be unresponsive to bank risks
- ▶ Any such incentives to increase risks must be countered by **other regulatory measures**

Summary

- ▶ Deposit insurance premia that do not take into account the risks banks take, provide incentives to increase risks
- ▶ Deposit insurance causes moral hazard as any losses to depositors are covered, allowing them to be unresponsive to bank risks
- ▶ Any such incentives to increase risks must be countered by other regulatory measures, such as **capital requirements**

Summary

- ▶ Deposit insurance premia that do not take into account the risks banks take, provide incentives to increase risks
- ▶ Deposit insurance causes moral hazard as any losses to depositors are covered, allowing them to be unresponsive to bank risks
- ▶ Any such incentives to increase risks must be countered by other regulatory measures, such as capital requirements
