

Collateral provision

# The impact of collateral

- ▶ Collateral are assets that the bank can obtain if the borrower defaults
- ▶ This would be assets in addition to those the bank could obtain as part of the default process
- ▶ Collateral increases the costs of default to borrowers
- ▶ Collateral reduces the losses of default to the bank

# The use of collateral

- ▶ If the risk to banks is reduced, this should reduce the loan rate
- ▶ Borrowers weigh up the reduced loan costs against the potential loss of the collateral in default
- ▶ We will look at the motivation for companies to provide collateral and banks to demand collateral
- ▶ Banks may also use collateral they have obtained to obtain loans themselves and we will look at why borrowers would agree to that

# Providing collateral

- ▶ Not all borrowers provide collateral, despite the loan costs being lower
- ▶ The motivation for borrowers to provide collateral will be explored and how banks can use this decision to their advantage
- ▶ Banks have to offer contracts with and without collateral for borrowers to have a choice and we will see that this is an equilibrium

Andreas Krause

Chapter 8.2.1  
Identifying company types through collateral

## Discussion of model results

- ▶ Low-risk companies provide collateral and high-risk companies prefer to not provide collateral
- ▶ Banks will offer contracts that allow them to distinguish the type of borrower
- ? If we observe that a borrower does not provide collateral, can we conclude it is high-risk?
- ! Collateral can only be provided if it exists; many companies will have no collateral to offer or it is already pledged for other loans

## Re-use of collateral

- ▶ Collateral obtained from a borrower could be used by banks as collateral in their own borrowing
- ▶ This is referred to as rehypothecation
- ▶ Borrowers might lose their collateral if the bank fails to repay its loan and will have to agree to this process

Andreas Krause

Chapter 8.3  
Rehypothecation

## Discussion of model results

- ▶ Banks can make additional profits using the collateral for their purposes, allowing them to offer loans they would otherwise find not profitable
- ▶ Borrowers benefit by gaining access to loans they would otherwise not have
- ? Why would a company ever not agree to rehypothecation as long as the value of the collateral is below the repayment of the loan?
- ! The value of the collateral to the company might be higher than the value to the bank, for example essential equipment or patents

## Summary of key results

- ▶ Collateral can be used to distinguish borrowers with different risks, reducing adverse selection
- ▶ Collateral can be more widely used by banks, reducing the impact of moral hazard
- ▶ Collateral affects information asymmetry and incentives, allowing loan markets to be more efficient
