## Risk-free and risky bonds

## Risk-free and risky bonds

- ▶ Bonds are often regarded as **risk-free** with the assumption that all payments due will be always be made

## Risk-free and risky bonds

- ▶ Bonds are often regarded as risk-free with the assumption that all payments due will be always be made
- ▶ This is true for bonds issued by most of the major **developed countries** and international organisations

- ▶ Bonds issued by companies, banks, insurance companies and less developed countries are classed as **risky**

# Explaining different yields

## Explaining different yields

- ▶ Bonds are available in a **range of maturities**

## Explaining different yields

- ▶ Bonds are available in a range of maturities, typically ranging from 1 month to 50 years

Yield curves

# Yield curves as predictors

## Yield curves as predictors

# The risk of changing interest rates

## The risk of changing interest rates

- ▶ Yields of bonds do not only change in the predictable manner implied by the yield curve, but might be subject to changes due to **market forces** and **unexpected macroeconomic events**
