

Dividends represent the payments made to shareholders of a company

▶ Dividends represent the payments made to shareholders of a company and reduce the equity the company holds

- ▶ Dividends represent the payments made to shareholders of a company and reduce the equity the company holds
- ► This reduction in equity could lead to a reduction in investments the company can make

- ▶ Dividends represent the payments made to shareholders of a company and reduce the equity the company holds
- This reduction in equity could lead to a reduction in investments the company can make
- Companies can raise equity to increase the investments they can make

- ▶ Dividends represent the payments made to shareholders of a company and reduce the equity the company holds
- This reduction in equity could lead to a reduction in investments the company can make
- Companies can raise equity to increase the investments they can make
- Dividends enter the formula valuing the company

- ▶ Dividends represent the payments made to shareholders of a company and reduce the equity the company holds
- This reduction in equity could lead to a reduction in investments the company can make
- Companies can raise equity to increase the investments they can make
- Dividends enter the formula valuing the company and reducing them should reduce the company value

- ▶ Dividends represent the payments made to shareholders of a company and reduce the equity the company holds
- This reduction in equity could lead to a reduction in investments the company can make
- Companies can raise equity to increase the investments they can make
- Dividends enter the formula valuing the company and reducing them should reduce the company value

► The current price should reflect the present value of the future dividend

$$P_t = \frac{d_{t+1}}{1+\mu}$$

- ► The current price should reflect the present value of the future dividend and the price that can be obtained
- $P_t = \frac{d_{t+1} + P_{t+1}}{1+\mu}$

- ► The current price should reflect the present value of the future dividend and the price that can be obtained
- $P_t = \frac{d_{t+1} + P_{t+1}}{1 + \mu}$
- ► A company makes investments which are financed by retained earnings
- $I_{t+1} = (E_t d_{t+1})$

- ► The current price should reflect the present value of the future dividend and the price that can be obtained
- $P_t = \frac{d_{t+1} + P_{t+1}}{1 + \mu}$
- ► A company makes investments which are financed by retained earnings and the issue of new shares
- $I_{t+1} = (E_t d_{t+1}) + S_{t+1}$

- ► The current price should reflect the present value of the future dividend and the price that can be obtained
- $P_t = \frac{d_{t+1} + P_{t+1}}{1 + \mu}$
- A company makes investments which are financed by retained earnings and the issue of new shares
- $I_{t+1} = (E_t d_{t+1}) + S_{t+1}$
- $\Rightarrow d_{t+1} = E_t + S_{t+1} I_{t+1}$

- ► The current price should reflect the present value of the future dividend and the price that can be obtained
- $P_t = \frac{d_{t+1} + P_{t+1}}{1 + \mu}$
- A company makes investments which are financed by retained earnings and the issue of new shares
- $I_{t+1} = (E_t d_{t+1}) + S_{t+1}$
- $\Rightarrow d_{t+1} = E_t + S_{t+1} I_{t+1}$
- $\Rightarrow P_t = \frac{E_t + S_{t+1} I_{t+1} + P_{t+1}}{1 + \mu}$

- The current price should reflect the present value of the future dividend and the price that can be obtained
- $P_t = \frac{d_{t+1} + P_{t+1}}{1 + \mu}$
- A company makes investments which are financed by retained earnings and the issue of new shares
- $I_{t+1} = (E_t d_{t+1}) + S_{t+1}$
- $\Rightarrow d_{t+1} = E_t + S_{t+1} I_{t+1}$
- $\Rightarrow P_t = \frac{E_t + S_{t+1} I_{t+1} + P_{t+1}}{1 + \mu}$
- Dividends are not part of the value of the company

- The current price should reflect the present value of the future dividend and the price that can be obtained
- $P_t = \frac{d_{t+1} + P_{t+1}}{1 + \mu}$
- A company makes investments which are financed by retained earnings and the issue of new shares
- $I_{t+1} = (E_t d_{t+1}) + S_{t+1}$
- $\Rightarrow d_{t+1} = E_t + S_{t+1} I_{t+1}$
- $\Rightarrow P_t = \frac{E_t + S_{t+1} I_{t+1} + P_{t+1}}{1 + \mu}$
 - Dividends are not part of the value of the company and hence dividends are irrelevant

- The current price should reflect the present value of the future dividend and the price that can be obtained
- $P_t = \frac{d_{t+1} + P_{t+1}}{1 + \mu}$
- A company makes investments which are financed by retained earnings and the issue of new shares
- $I_{t+1} = (E_t d_{t+1}) + S_{t+1}$
- $\Rightarrow d_{t+1} = E_t + S_{t+1} I_{t+1}$
- $\Rightarrow P_t = \frac{E_t + S_{t+1} I_{t+1} + P_{t+1}}{1 + \mu}$
- Dividends are not part of the value of the company and hence dividends are irrelevant

▶ Dividend payments can be made at any level and the funds paid out recovered through issuing shares

- ▶ Dividend payments can be made at any level and the funds paid out recovered through issuing shares
- ► The overall value of the company is not affected

- ▶ Dividend payments can be made at any level and the funds paid out recovered through issuing shares
- ► The overall value of the company is not affected
- ► This result is known as Miller and Modigliani's dividend irrelevance

- Dividend payments can be made at any level and the funds paid out recovered through issuing shares
- The overall value of the company is not affected
- This result is known as Miller and Modigliani's dividend irrelevance
- Implicitly it assumes that companies can continue with investments that add the same value in the future as they have in the past

- Dividend payments can be made at any level and the funds paid out recovered through issuing shares
- The overall value of the company is not affected
- This result is known as Miller and Modigliani's dividend irrelevance
- Implicitly it assumes that companies can continue with investments that add the same value in the future as they have in the past

Companies generating earnings usually accumulate cash

- Companies generating earnings usually accumulate cash
- ► This cash can be used to make investments

- Companies generating earnings usually accumulate cash
- ► This cash can be used to make investments or pay dividends

- Companies generating earnings usually accumulate cash
- ► This cash can be used to make investments or pay dividends
- ► If not sufficient good investments are available, managers might use the excess cash on vanity projects

- Companies generating earnings usually accumulate cash
- ► This cash can be used to make investments or pay dividends
- ► If not sufficient good investments are available, managers might use the excess cash on vanity projects or excessive benefits

- ► Companies generating earnings usually accumulate cash
- ► This cash can be used to make investments or pay dividends
- If not sufficient good investments are available, managers might use the excess cash on vanity projects or excessive benefits
- ► This moral hazard would reduce the value of the company

- ► Companies generating earnings usually accumulate cash
- This cash can be used to make investments or pay dividends
- If not sufficient good investments are available, managers might use the excess cash on vanity projects or excessive benefits
- This moral hazard would reduce the value of the company
- ⇒ Paying dividends can reduce moral hazard

- ► Companies generating earnings usually accumulate cash
- This cash can be used to make investments or pay dividends
- If not sufficient good investments are available, managers might use the excess cash on vanity projects or excessive benefits
- ► This moral hazard would reduce the value of the company
- ⇒ Paying dividends can reduce moral hazard and increase company value

- Companies generating earnings usually accumulate cash
- This cash can be used to make investments or pay dividends
- If not sufficient good investments are available, managers might use the excess cash on vanity projects or excessive benefits
- ► This moral hazard would reduce the value of the company
- ⇒ Paying dividends can reduce moral hazard and increase company value
