

Rational herding

# The existence of herding

# The existence of herding

- ▶ Generally relying on **information** should allow traders to make more profits than remaining uninformed

# The existence of herding

- ▶ Generally relying on information should allow traders to make more profits than remaining uninformed
- ▶ It is common to find traders **herding**

# The existence of herding

- ▶ Generally relying on information should allow traders to make more profits than remaining uninformed
- ▶ It is common to find traders herding, suggesting that such behaviour is **rational** and profitable

# The existence of herding

- ▶ Generally relying on information should allow traders to make more profits than remaining uninformed
- ▶ It is common to find traders herding, suggesting that such behaviour is rational and profitable
- ▶ With those herding not relying on information, their uninformed trading should be subject to **adverse selection**

# The existence of herding

- ▶ Generally relying on information should allow traders to make more profits than remaining uninformed
- ▶ It is common to find traders herding, suggesting that such behaviour is rational and profitable
- ▶ With those herding not relying on information, their uninformed trading should be subject to adverse selection

# Revealing asset values

## Revealing asset values

- ▶ The value of an asset is revealed **publicly** either after two rounds of trading or only in the more distant future

# Revealing asset values

- ▶ The value of an asset is revealed publicly either after two rounds of trading or only in the more distant future
- ▶ If the value is revealed, the asset **trades at that price** from round 3 onwards

# Revealing asset values

- ▶ The value of an asset is revealed publicly either after two rounds of trading or only in the more distant future
- ▶ If the value is revealed, the asset trades at that price from round 3 onwards
- ▶ If the value is not revealed, the asset will **continue to trade at the price of round 2**

# Revealing asset values

- ▶ The value of an asset is revealed publicly either after two rounds of trading or only in the more distant future
- ▶ If the value is revealed, the asset trades at that price from round 3 onwards
- ▶ If the value is not revealed, the asset will continue to trade at the price of round 2
- ▶ The time horizon of any trader extends only to **two trading rounds**

# Revealing asset values

- ▶ The value of an asset is revealed publicly either after two rounds of trading or only in the more distant future
- ▶ If the value is revealed, the asset trades at that price from round 3 onwards
- ▶ If the value is not revealed, the asset will continue to trade at the price of round 2
- ▶ The time horizon of any trader extends only to two trading rounds

# Informed and uninformed traders

# Informed and uninformed traders

- ▶ Traders can decide to become informed at **no cost**

# Informed and uninformed traders

- ▶ Traders can decide to become informed at no cost or stay **uninformed**

# Informed and uninformed traders

- ▶ Traders can decide to become informed at no cost or stay uninformed
- ▶ **Informed traders** learn the value of the asset

# Informed and uninformed traders

- ▶ Traders can decide to become informed at no cost or stay uninformed
- ▶ Informed traders learn the value of the asset
- ▶ **Uninformed traders** have no information on the asset value

# Informed and uninformed traders

- ▶ Traders can decide to become informed at no cost or stay uninformed
- ▶ Informed traders learn the value of the asset
- ▶ Uninformed traders have no information on the asset value, but will follow a **common signal**

# Informed and uninformed traders

- ▶ Traders can decide to become informed at no cost or stay uninformed
- ▶ Informed traders learn the value of the asset
- ▶ Uninformed traders have no information on the asset value, but will follow a common signal
- ▶ This signal has **no relation** to the asset value

# Informed and uninformed traders

- ▶ Traders can decide to become informed at no cost or stay uninformed
- ▶ Informed traders learn the value of the asset
- ▶ Uninformed traders have no information on the asset value, but will follow a common signal
- ▶ This signal has no relation to the asset value, it is **uninformative**

# Informed and uninformed traders

- ▶ Traders can decide to become informed at no cost or stay uninformed
- ▶ Informed traders learn the value of the asset
- ▶ Uninformed traders have no information on the asset value, but will follow a common signal
- ▶ This signal has no relation to the asset value, it is uninformative
- ▶ Informed traders do not know **which** signal these traders follow

# Informed and uninformed traders

- ▶ Traders can decide to become informed at no cost or stay uninformed
- ▶ Informed traders learn the value of the asset
- ▶ Uninformed traders have no information on the asset value, but will follow a common signal
- ▶ This signal has no relation to the asset value, it is uninformative
- ▶ Informed traders do not know which signal these traders follow

# Processing information and signals

# Processing information and signals

- ▶ Trading happens in **two rounds**

# Processing information and signals

- ▶ Trading happens in two rounds and which round a trader chooses is **random**

# Processing information and signals

- ▶ Trading happens in two rounds and which round a trader chooses is random
- ▶ Traders might submit orders at **different speeds** given their other duties

# Processing information and signals

- ▶ Trading happens in two rounds and which round a trader chooses is random
- ▶ Traders might submit orders at different speeds given their other duties
- ▶ The commitment to trade is made in the **first round** of trading

# Processing information and signals

- ▶ Trading happens in two rounds and which round a trader chooses is random
  - ▶ Traders might submit orders at different speeds given their other duties
  - ▶ The commitment to trade is made in the first round of trading
- ⇒ The orders submitted in round 1 and round 2 are **identical**

# Processing information and signals

- ▶ Trading happens in two rounds and which round a trader chooses is random
  - ▶ Traders might submit orders at different speeds given their other duties
  - ▶ The commitment to trade is made in the first round of trading
- ⇒ The orders submitted in round 1 and round 2 are identical

# Price setting

# Price setting

- ▶ Prices are set in response to **market demand**

# Price setting

- ▶ Prices are set in response to market demand
- ▶ If on aggregate traders buy the price **increase**

# Price setting

- ▶ Prices are set in response to market demand
- ▶ If on aggregate traders buy the price increase and if on aggregate they sell the price **decreases**

# Price setting

- ▶ Prices are set in response to market demand
- ▶ If on aggregate traders buy the price increase and if on aggregate they sell the price decreases
- ▶ How much this price change is, depends on the amount of **informed trading**

# Price setting

- ▶ Prices are set in response to market demand
- ▶ If on aggregate traders buy the price increase and if on aggregate they sell the price decreases
- ▶ How much this price change is, depends on the amount of informed trading
- ▶ **Few informed traders** will not cause the price to change much for a given net demand

# Price setting

- ▶ Prices are set in response to market demand
- ▶ If on aggregate traders buy the price increase and if on aggregate they sell the price decreases
- ▶ How much this price change is, depends on the amount of informed trading
- ▶ Few informed traders will not cause the price to change much for a given net demand
- ▶ **Many informed traders** will cause the price to change much for a given net demand

# Price setting

- ▶ Prices are set in response to market demand
- ▶ If on aggregate traders buy the price increase and if on aggregate they sell the price decreases
- ▶ How much this price change is, depends on the amount of informed trading
- ▶ Few informed traders will not cause the price to change much for a given net demand
- ▶ Many informed traders will cause the price to change much for a given net demand

# Losses when revealing asset value

## Losses when revealing asset value

- ▶ Uninformed traders will on average make **losses** if the value is revealed due to adverse selection

## Losses when revealing asset value

- ▶ Uninformed traders will on average make losses if the value is revealed due to adverse selection
- ▶ If the value is not revealed, the price does not move after the second round of trading and uninformed traders may make a **profit**

# Losses when revealing asset value

- ▶ Uninformed traders will on average make losses if the value is revealed due to adverse selection
- ▶ If the value is not revealed, the price does not move after the second round of trading and uninformed traders may make a profit
- ▶ If the information is **likely** to be revealed, uninformed traders expect a loss and will not trade

# Losses when revealing asset value

- ▶ Uninformed traders will on average make losses if the value is revealed due to adverse selection
- ▶ If the value is not revealed, the price does not move after the second round of trading and uninformed traders may make a profit
- ▶ If the information is likely to be revealed, uninformed traders expect a loss and will not trade

# Emergence of herding

## Emergence of herding

- ▶ If the information is not revealed, uninformed traders might make a **profit**

# Emergence of herding

- ▶ If the information is not revealed, uninformed traders might make a profit
- ▶ This will require that their orders **dominate the market** against informed traders

# Emergence of herding

- ▶ If the information is not revealed, uninformed traders might make a profit
- ▶ This will require that their orders dominate the market against informed traders
- ⇒ As similar orders are submitted in round 2 as in round 1, the price will continue in a trend

# Emergence of herding

- ▶ If the information is not revealed, uninformed traders might make a profit
- ▶ This will require that their orders dominate the market against informed traders
- ⇒ As similar orders are submitted in round 2 as in round 1, the price will continue in a trend
- ⇒ Traders in **round 1** will get a more favourable price

# Emergence of herding

- ▶ If the information is not revealed, uninformed traders might make a profit
- ▶ This will require that their orders dominate the market against informed traders
- ⇒ As similar orders are submitted in round 2 as in round 1, the price will continue in a trend
- ⇒ Traders in round 1 will get a more favourable price and as the price of round 2 remains, can make a **profit**

# Emergence of herding

- ▶ If the information is not revealed, uninformed traders might make a profit
- ▶ This will require that their orders dominate the market against informed traders
- ⇒ As similar orders are submitted in round 2 as in round 1, the price will continue in a trend
- ⇒ Traders in round 1 will get a more favourable price and as the price of round 2 remains, can make a profit
- ▶ This requires uninformed traders to **coordinate** their trading on the common signal

# Emergence of herding

- ▶ If the information is not revealed, uninformed traders might make a profit
- ▶ This will require that their orders dominate the market against informed traders
- ⇒ As similar orders are submitted in round 2 as in round 1, the price will continue in a trend
- ⇒ Traders in round 1 will get a more favourable price and as the price of round 2 remains, can make a profit
- ▶ This requires uninformed traders to coordinate their trading on the common signal
- ▶ As the signal is not informative, uninformed traders are **herding**

# Emergence of herding

- ▶ If the information is not revealed, uninformed traders might make a profit
- ▶ This will require that their orders dominate the market against informed traders
- ⇒ As similar orders are submitted in round 2 as in round 1, the price will continue in a trend
- ⇒ Traders in round 1 will get a more favourable price and as the price of round 2 remains, can make a profit
- ▶ This requires uninformed traders to coordinate their trading on the common signal
- ▶ As the signal is not informative, uninformed traders are herding

# High fraction of uninformed traders

# High fraction of uninformed traders

- ▶ **Informed traders** will trade more aggressively

# High fraction of uninformed traders

- ▶ Informed traders will trade more aggressively due to having **better information** than uninformed traders

# High fraction of uninformed traders

- ▶ Informed traders will trade more aggressively due to having better information than uninformed traders
- ▶ This requires **many more uninformed traders** than informed traders to dominate the market

# High fraction of uninformed traders

- ▶ Informed traders will trade more aggressively due to having better information than uninformed traders
- ▶ This requires many more uninformed traders than informed traders to dominate the market
- ▶ If there are less informed traders, their profits will be **higher** as they can exploit their informational advantage better

# High fraction of uninformed traders

- ▶ Informed traders will trade more aggressively due to having better information than uninformed traders
- ▶ This requires many more uninformed traders than informed traders to dominate the market
- ▶ If there are less informed traders, their profits will be higher as they can exploit their informational advantage better
- ▶ This will strike a balance in the number of traders who **become informed**

# High fraction of uninformed traders

- ▶ Informed traders will trade more aggressively due to having better information than uninformed traders
- ▶ This requires many more uninformed traders than informed traders to dominate the market
- ▶ If there are less informed traders, their profits will be higher as they can exploit their informational advantage better
- ▶ This will strike a balance in the number of traders who become informed, but **not all** traders will be uninformed

# High fraction of uninformed traders

- ▶ Informed traders will trade more aggressively due to having better information than uninformed traders
- ▶ This requires many more uninformed traders than informed traders to dominate the market
- ▶ If there are less informed traders, their profits will be higher as they can exploit their informational advantage better
- ▶ This will strike a balance in the number of traders who become informed, but not all traders will be uninformed

# Low probability of information revelation

# Low probability of information revelation

- ▶ Uninformed traders realise their profits if the information is **not revealed**

# Low probability of information revelation

- ▶ Uninformed traders realise their profits if the information is not revealed
- ▶ For profits from herding to be sufficiently high compared to becoming informed, information must **not be revealed too often**

# Low probability of information revelation

- ▶ Uninformed traders realise their profits if the information is not revealed
- ▶ For profits from herding to be sufficiently high compared to becoming informed, information must not be revealed too often
- ⇒ Herding is feasible if the information is **unlikely** to be revealed

# Low probability of information revelation

- ▶ Uninformed traders realise their profits if the information is not revealed
- ▶ For profits from herding to be sufficiently high compared to becoming informed, information must not be revealed too often
- ⇒ Herding is feasible if the information is unlikely to be revealed

# Profitable herding

# Profitable herding

- ▶ Herding allows uninformed traders to induce a **trend** into the market that they can benefit from if they enter the market early

# Profitable herding

- ▶ Herding allows uninformed traders to induce a trend into the market that they can benefit from if they enter the market early
- ▶ Herding can be **more profitable** to traders than informed trading

# Profitable herding

- ▶ Herding allows uninformed traders to induce a trend into the market that they can benefit from if they enter the market early
- ▶ Herding can be more profitable to traders than informed trading, even if information is **free**

# Profitable herding

- ▶ Herding allows uninformed traders to induce a trend into the market that they can benefit from if they enter the market early
- ▶ Herding can be more profitable to traders than informed trading, even if information is free
- ▶ In equilibrium we will need a **large fraction** of herders in the market

# Profitable herding

- ▶ Herding allows uninformed traders to induce a trend into the market that they can benefit from if they enter the market early
- ▶ Herding can be more profitable to traders than informed trading, even if information is free
- ▶ In equilibrium we will need a large fraction of herders in the market

# Conditions for herding

# Conditions for herding

- ▶ Herding is profitable if information is **unlikely to be revealed**

# Conditions for herding

- ▶ Herding is profitable if information is unlikely to be revealed and **sufficient numbers** of traders coordinate in the herd

# Conditions for herding

- ▶ Herding is profitable if information is unlikely to be revealed and sufficient numbers of traders coordinate in the herd
- ▶ The price in such a market can deviate from the value implied by available information

# Conditions for herding

- ▶ Herding is profitable if information is unlikely to be revealed and sufficient numbers of traders coordinate in the herd
- ▶ The price in such a market can deviate from the value implied by available information
- ▶ It can be rational for traders to **ignore information** they have and join the herding

# Conditions for herding

- ▶ Herding is profitable if information is unlikely to be revealed and sufficient numbers of traders coordinate in the herd
- ▶ The price in such a market can deviate from the value implied by available information
- ▶ It can be rational for traders to ignore information they have and join the herding
