

Chapter 18.2

Delegation of decision-making

# Outline

■ Problem and model assumptions

■ Delegated decision-making

■ Centralised decision-making

■ Summary

## ■ Problem and model assumptions

■ Delegated decision-making

■ Centralised decision-making

■ Summary

# Ideas and their implementation

# Ideas and their implementation

- ▶ Investment banks give staff significant **responsibilities** in providing advice to clients

# Ideas and their implementation

- ▶ Investment banks give staff significant responsibilities in providing advice to clients
- ▶ It is usually the **team working with a client** that develops advice

# Ideas and their implementation

- ▶ Investment banks give staff significant responsibilities in providing advice to clients
- ▶ It is usually the team working with a client that develops advice and then seeks to **implement** it for their client

# Ideas and their implementation

- ▶ Investment banks give staff significant responsibilities in providing advice to clients
- ▶ It is usually the team working with a client that develops advice and then seeks to implement it for their client
- ▶ In many other organisations, ideas are **developed by managers** and then implemented by employees

# Ideas and their implementation

- ▶ Investment banks give staff significant responsibilities in providing advice to clients
- ▶ It is usually the team working with a client that develops advice and then seeks to implement it for their client
- ▶ In many other organisations, ideas are developed by managers and then implemented by employees

# Signals about clients

# Signals about clients

- ▶ Assume the investment bank decides whether to accept a **new client**

# Signals about clients

- ▶ Assume the investment bank decides whether to accept a new client, the probability that it will **generate surplus** is  $p = \frac{1}{2}$

# Signals about clients

- ▶ Assume the investment bank decides whether to accept a new client, the probability that it will generate surplus is  $p = \frac{1}{2}$
- ▶ Managers and employees obtain a **signal** with precision  $\rho_i > \frac{1}{2}$

# Signals about clients

- ▶ Assume the investment bank decides whether to accept a new client, the probability that it will generate surplus is  $p = \frac{1}{2}$
- ▶ Managers and employees obtain a signal with precision  $\rho_i > \frac{1}{2}$
- ▶ Bayesian learning gives the probability of the client generating a surplus **after** receiving the signal as  $\hat{p}_i = \frac{p\rho_i}{p\rho_i + (1-p)(1-\rho_i)} = \rho_i$

# Signals about clients

- ▶ Assume the investment bank decides whether to accept a new client, the probability that it will generate surplus is  $p = \frac{1}{2}$
- ▶ Managers and employees obtain a signal with precision  $\rho_i > \frac{1}{2}$
- ▶ Bayesian learning gives the probability of the client generating a surplus after receiving the signal as  $\hat{p}_i = \frac{p\rho_i}{p\rho_i + (1-p)(1-\rho_i)} = \rho_i$

# Remuneration of employees

# Remuneration of employees

- ▶ Employees are working with the client

## Remuneration of employees

- ▶ Employees are working with the client and have to exert **effort** to generate surplus, which costs them  $C$

# Remuneration of employees

- ▶ Employees are working with the client and have to exert effort to generate surplus, which costs them  $C$
- ▶ **Managers** do not exert effort

# Remuneration of employees

- ▶ Employees are working with the client and have to exert effort to generate surplus, which costs them  $C$
- ▶ Managers do not exert effort as they are **not** involved in working with the client

# Remuneration of employees

- ▶ Employees are working with the client and have to exert effort to generate surplus, which costs them  $C$
- ▶ Managers do not exert effort as they are not involved in working with the client
- ▶ Employees are paid a wage  $w_S$  if **surplus** is generated

# Remuneration of employees

- ▶ Employees are working with the client and have to exert effort to generate surplus, which costs them  $C$
- ▶ Managers do not exert effort as they are not involved in working with the client
- ▶ Employees are paid a wage  $w_S$  if surplus is generated and  $w_F \leq 0$  if **no surplus** is generated

# Remuneration of employees

- ▶ Employees are working with the client and have to exert effort to generate surplus, which costs them  $C$
- ▶ Managers do not exert effort as they are not involved in working with the client
- ▶ Employees are paid a wage  $w_S$  if surplus is generated and  $w_F \leq 0$  if no surplus is generated
- ▶ If no surplus is generated, the negative wage can be interpreted as **losing a bonus**

# Remuneration of employees

- ▶ Employees are working with the client and have to exert effort to generate surplus, which costs them  $C$
- ▶ Managers do not exert effort as they are not involved in working with the client
- ▶ Employees are paid a wage  $w_S$  if surplus is generated and  $w_F \leq 0$  if no surplus is generated
- ▶ If no surplus is generated, the negative wage can be interpreted as losing a bonus
- ▶ Managers are rewarded through the **profits** they generate

# Remuneration of employees

- ▶ Employees are working with the client and have to exert effort to generate surplus, which costs them  $C$
- ▶ Managers do not exert effort as they are not involved in working with the client
- ▶ Employees are paid a wage  $w_S$  if surplus is generated and  $w_F \leq 0$  if no surplus is generated
- ▶ If no surplus is generated, the negative wage can be interpreted as losing a bonus
- ▶ Managers are rewarded through the profits they generate

## ■ Problem and model assumptions

## ■ Delegated decision-making

## ■ Centralised decision-making

## ■ Summary

# Employees exerting effort

# Employees exerting effort

- ▶ Expected wage:  $w = \rho_E w_S + (1 - \rho_E) w_F$

# Employees exerting effort

- ▶ Expected wage:  $w = \rho_E w_S + (1 - \rho_E) w_F$
- ▶ If **no effort** is exerted, no surplus is generated

# Employees exerting effort

- ▶ Expected wage:  $w = \rho_E w_S + (1 - \rho_E) w_F$
- ▶ If no effort is exerted, no surplus is generated and the employees receives  $w_F$

# Employees exerting effort

- ▶ Expected wage:  $w = \rho_E w_S + (1 - \rho_E) w_F$
- ▶ If no effort is exerted, no surplus is generated and the employees receives  $w_F$
- ▶ To exert effort, we need  $w - C \geq w_F$

# Employees exerting effort

- ▶ Expected wage:  $w = \rho_E w_S + (1 - \rho_E) w_F$
- ▶ If no effort is exerted, no surplus is generated and the employees receives  $w_F$
- ▶ To exert effort, we need  $w - C \geq w_F$ , or  $w_S \geq w_F + \frac{C}{\rho_E}$

# Employees exerting effort

- ▶ Expected wage:  $w = \rho_E w_S + (1 - \rho_E) w_F$
- ▶ If no effort is exerted, no surplus is generated and the employees receives  $w_F$
- ▶ To exert effort, we need  $w - C \geq w_F$ , or  $w_S \geq w_F + \frac{C}{\rho_E}$
- ▶ To be an employee, we need  $w - C \geq 0$

# Employees exerting effort

- ▶ Expected wage:  $w = \rho_E w_S + (1 - \rho_E) w_F$
- ▶ If no effort is exerted, no surplus is generated and the employees receives  $w_F$
- ▶ To exert effort, we need  $w - C \geq w_F$ , or  $w_S \geq w_F + \frac{C}{\rho_E}$
- ▶ To be an employee, we need  $w - C \geq 0$ , or  $w_S \geq -\frac{1 - \rho_E}{\rho_E} w_F + \frac{C}{\rho_E}$

# Employees exerting effort

- ▶ Expected wage:  $w = \rho_E w_S + (1 - \rho_E) w_F$
- ▶ If no effort is exerted, no surplus is generated and the employees receives  $w_F$
- ▶ To exert effort, we need  $w - C \geq w_F$ , or  $w_S \geq w_F + \frac{C}{\rho_E}$
- ▶ To be an employee, we need  $w - C \geq 0$ , or  $w_S \geq -\frac{1-\rho_E}{\rho_E} w_F + \frac{C}{\rho_E}$
- ▶ As  $w_F \leq 0$ , the **latter** is more restrictive

# Employees exerting effort

- ▶ Expected wage:  $w = \rho_E w_S + (1 - \rho_E) w_F$
- ▶ If no effort is exerted, no surplus is generated and the employees receives  $w_F$
- ▶ To exert effort, we need  $w - C \geq w_F$ , or  $w_S \geq w_F + \frac{C}{\rho_E}$
- ▶ To be an employee, we need  $w - C \geq 0$ , or  $w_S \geq -\frac{1 - \rho_E}{\rho_E} w_F + \frac{C}{\rho_E}$
- ▶ As  $w_F \leq 0$ , the latter is more restrictive and  $w_S = -\frac{1 - \rho_E}{\rho_E} w_F + \frac{C}{\rho_E}$

# Employees exerting effort

- ▶ Expected wage:  $w = \rho_E w_S + (1 - \rho_E) w_F$
- ▶ If no effort is exerted, no surplus is generated and the employees receives  $w_F$
- ▶ To exert effort, we need  $w - C \geq w_F$ , or  $w_S \geq w_F + \frac{C}{\rho_E}$
- ▶ To be an employee, we need  $w - C \geq 0$ , or  $w_S \geq -\frac{1 - \rho_E}{\rho_E} w_F + \frac{C}{\rho_E}$
- ▶ As  $w_F \leq 0$ , the latter is more restrictive and  $w_S = -\frac{1 - \rho_E}{\rho_E} w_F + \frac{C}{\rho_E}$
- ▶ We then get  $w = C$  and the employee breaks even

# Employees exerting effort

- ▶ Expected wage:  $w = \rho_E w_S + (1 - \rho_E) w_F$
- ▶ If no effort is exerted, no surplus is generated and the employees receives  $w_F$
- ▶ To exert effort, we need  $w - C \geq w_F$ , or  $w_S \geq w_F + \frac{C}{\rho_E}$
- ▶ To be an employee, we need  $w - C \geq 0$ , or  $w_S \geq -\frac{1 - \rho_E}{\rho_E} w_F + \frac{C}{\rho_E}$
- ▶ As  $w_F \leq 0$ , the latter is more restrictive and  $w_S = -\frac{1 - \rho_E}{\rho_E} w_F + \frac{C}{\rho_E}$
- ▶ We then get  $w = C$  and the employee breaks even

# Investment bank profits

# Investment bank profits

- ▶ Investment bank profits are the **revenue**
- ▶  $\Pi_D = V$

# Investment bank profits

- ▶ Investment bank profits are the **revenue**, if the client generates such
- ▶  $\Pi_D = \rho_E V$

# Investment bank profits

- ▶ Investment bank profits are the **revenue**, **if** the client generates such, less the **wages** paid to employees
- ▶  $\Pi_D = \rho_E V - w$

# Investment bank profits

- ▶ Investment bank profits are the revenue, if the client generates such, less the wages paid to employees
- ▶  $\Pi_D = \rho_E V - w = \rho_E V - C$

# Investment bank profits

- ▶ Investment bank profits are the revenue, if the client generates such, less the wages paid to employees
- ▶  $\Pi_D = \rho_E V - w = \rho_E V - C$
- ▶ Managers are paid out of these **profits**

# Investment bank profits

- ▶ Investment bank profits are the revenue, if the client generates such, less the wages paid to employees
- ▶  $\Pi_D = \rho_E V - w = \rho_E V - C$
- ▶ Managers are paid out of these profits

## ■ Problem and model assumptions

## ■ Delegated decision-making

## ■ Centralised decision-making

## ■ Summary

# Learning from two signals

## Learning from two signals

- ▶ If the manager decides to accept the client, the employee has **two signals**

## Learning from two signals

- ▶ If the manager decides to accept the client, the employee has two signals: his own **and** that of the manager

# Learning from two signals

- ▶ If the manager decides to accept the client, the employee has two signals: his own and that of the manager
- ▶ The signal of the manager is **positive**

## Learning from two signals

- ▶ If the manager decides to accept the client, the employee has two signals: his own and that of the manager
- ▶ The signal of the manager is positive as else he would **not** have accepted the client

## Learning from two signals

- ▶ If the manager decides to accept the client, the employee has two signals: his own and that of the manager
- ▶ The signal of the manager is positive as else he would not have accepted the client
- ▶ The employee would **update** his beliefs in the probability the client produces surplus

## Learning from two signals

- ▶ If the manager decides to accept the client, the employee has two signals: his own and that of the manager
- ▶ The signal of the manager is positive as else he would not have accepted the client
- ▶ The employee would update his beliefs in the probability the client produces surplus
- ▶ If the employee also receives a **positive** signal, we get  $\pi_H = \frac{\rho_E \rho_M}{\rho_E \rho_M + (1-\rho_E)(1-\rho_M)}$

## Learning from two signals

- ▶ If the manager decides to accept the client, the employee has two signals: his own and that of the manager
- ▶ The signal of the manager is positive as else he would not have accepted the client
- ▶ The employee would update his beliefs in the probability the client produces surplus
- ▶ If the employee also receives a positive signal, we get  $\pi_H = \frac{\rho_E \rho_M}{\rho_E \rho_M + (1-\rho_E)(1-\rho_M)}$
- ▶ If the employee receives a **negative** signal, we get  $\pi_L = \frac{\rho_M(1-\rho_E)}{\rho_M(1-\rho_E) + (1-\rho_M)\rho_E}$

## Learning from two signals

- ▶ If the manager decides to accept the client, the employee has two signals: his own and that of the manager
- ▶ The signal of the manager is positive as else he would not have accepted the client
- ▶ The employee would update his beliefs in the probability the client produces surplus
- ▶ If the employee also receives a positive signal, we get  $\pi_H = \frac{\rho_E \rho_M}{\rho_E \rho_M + (1-\rho_E)(1-\rho_M)}$
- ▶ If the employee receives a negative signal, we get  $\pi_L = \frac{\rho_M(1-\rho_E)}{\rho_M(1-\rho_E) + (1-\rho_M)\rho_E}$
- ▶ We find that  $\pi_H \geq \pi_L$

## Learning from two signals

- ▶ If the manager decides to accept the client, the employee has two signals: his own and that of the manager
- ▶ The signal of the manager is positive as else he would not have accepted the client
- ▶ The employee would update his beliefs in the probability the client produces surplus
- ▶ If the employee also receives a positive signal, we get  $\pi_H = \frac{\rho_E \rho_M}{\rho_E \rho_M + (1-\rho_E)(1-\rho_M)}$
- ▶ If the employee receives a negative signal, we get  $\pi_L = \frac{\rho_M(1-\rho_E)}{\rho_M(1-\rho_E) + (1-\rho_M)\rho_E}$
- ▶ We find that  $\pi_H \geq \pi_L$

# Wages of employees

# Wages of employees

- ▶ Expected wage:  $\hat{w} = \pi_i \hat{w}_S + (1 - \pi_i) w_F$

# Wages of employees

- ▶ Expected wage:  $\hat{w} = \pi_i \hat{w}_S + (1 - \pi_i) w_F$
- ▶ Exert effort if  $\hat{w} - C \geq w_F$

# Wages of employees

- ▶ Expected wage:  $\hat{w} = \pi_i \hat{w}_S + (1 - \pi_i) w_F$
- ▶ Exert effort if  $\hat{w} - C \geq w_F$
- ▶ This gives  $\hat{w}_S \geq w_F + \frac{C}{\pi_i}$

# Wages of employees

- ▶ Expected wage:  $\hat{w} = \pi_i \hat{w}_S + (1 - \pi_i) w_F$
- ▶ Exert effort if  $\hat{w} - C \geq w_F$
- ▶ This gives  $\hat{w}_S \geq w_F + \frac{C}{\pi_i}$
- ▶ To ensure the employee exerts efforts regardless of his signal, we set wages such that this is fulfilled for  $\pi_i = \pi_L$

# Wages of employees

- ▶ Expected wage:  $\hat{w} = \pi_i \hat{w}_S + (1 - \pi_i) w_F$
- ▶ Exert effort if  $\hat{w} - C \geq w_F$
- ▶ This gives  $\hat{w}_S \geq w_F + \frac{C}{\pi_i}$
- ▶ To ensure the employee exerts efforts regardless of his signal, we set wages such that this is fulfilled for  $\pi_i = \pi_L$
- ▶ This gives us  $\hat{w} = \rho_M \hat{w}_s + (1 - \rho_M) w_F = w_F + \frac{\rho_M}{\pi_L} C$

# Wages of employees

- ▶ Expected wage:  $\hat{w} = \pi_i \hat{w}_S + (1 - \pi_i) w_F$
- ▶ Exert effort if  $\hat{w} - C \geq w_F$
- ▶ This gives  $\hat{w}_S \geq w_F + \frac{C}{\pi_i}$
- ▶ To ensure the employee exerts efforts regardless of his signal, we set wages such that this is fulfilled for  $\pi_i = \pi_L$
- ▶ This gives us  $\hat{w} = \rho_M \hat{w}_s + (1 - \rho_M) w_F = w_F + \frac{\rho_M}{\pi_L} C$

# Investment bank profits

# Investment bank profits

- We have  $\Pi_C = \rho_M V - \hat{w}$

# Investment bank profits

- We have  $\Pi_C = \rho_M V - \hat{w} = \rho_M \left( V - \frac{C}{\pi_L} \right) - w_F$

# Investment bank profits

- ▶ We have  $\Pi_C = \rho_M V - \hat{w} = \rho_M \left( V - \frac{C}{\pi_L} \right) - w_F$
- ▶ To choose delegated decision-making we need  $\Pi_D \geq \Pi_C$

# Investment bank profits

- ▶ We have  $\Pi_C = \rho_M V - \hat{w} = \rho_M \left( V - \frac{C}{\pi_L} \right) - w_F$
- ▶ To choose delegated decision-making we need  $\Pi_D \geq \Pi_C$
- ▶ This requires  $\rho_M \leq \rho_M^* = \frac{\rho_E(1-\rho_E)V - (1-2\rho_E)C + (1-\rho_E)w_F}{(1-\rho_E)V - (1-2\rho_E)C}$

# Investment bank profits

- ▶ We have  $\Pi_C = \rho_M V - \hat{w} = \rho_M \left( V - \frac{C}{\pi_L} \right) - w_F$
- ▶ To choose delegated decision-making we need  $\Pi_D \geq \Pi_C$
- ▶ This requires  $\rho_M \leq \rho_M^* = \frac{\rho_E(1-\rho_E)V - (1-2\rho_E)C + (1-\rho_E)w_F}{(1-\rho_E)V - (1-2\rho_E)C}$
- ▶ If the manager's signal is **not too precise**, then delegated decision-making is optimal

# Investment bank profits

- ▶ We have  $\Pi_C = \rho_M V - \hat{w} = \rho_M \left( V - \frac{C}{\pi_L} \right) - w_F$
- ▶ To choose delegated decision-making we need  $\Pi_D \geq \Pi_C$
- ▶ This requires  $\rho_M \leq \rho_M^* = \frac{\rho_E(1-\rho_E)V - (1-2\rho_E)C + (1-\rho_E)w_F}{(1-\rho_E)V - (1-2\rho_E)C}$
- ▶ If the manager's signal is not too precise, then delegated decision-making is optimal
- ▶ This is **always fulfilled** if employees have more precise signals  $\rho_E > \rho_M$

# Investment bank profits

- ▶ We have  $\Pi_C = \rho_M V - \hat{w} = \rho_M \left( V - \frac{C}{\pi_L} \right) - w_F$
- ▶ To choose delegated decision-making we need  $\Pi_D \geq \Pi_C$
- ▶ This requires  $\rho_M \leq \rho_M^* = \frac{\rho_E(1-\rho_E)V - (1-2\rho_E)C + (1-\rho_E)w_F}{(1-\rho_E)V - (1-2\rho_E)C}$
- ▶ If the manager's signal is not too precise, then delegated decision-making is optimal
- ▶ This is always fulfilled if employees have more precise signals  $\rho_E > \rho_M$

# Delegation even if managers have more precise signals

# Delegation even if managers have more precise signals

- We have  $\rho_M^* > \rho_E$  if  $w_F > (1 - 2\rho_E) C$

# Delegation even if managers have more precise signals

- ▶ We have  $\rho_M^* > \rho_E$  if  $w_F > (1 - 2\rho_E)C$
- ▶ **Delegated** decision-making is preferred if  $\rho_E < \rho_M \leq \rho_M^*$

## Delegation even if managers have more precise signals

- ▶ We have  $\rho_M^* > \rho_E$  if  $w_F > (1 - 2\rho_E)C$
- ▶ Delegated decision-making is preferred if  $\rho_E < \rho_M \leq \rho_M^*$
- ▶ Even if manager's signals are **more precise**, delegation might be preferred

## Delegation even if managers have more precise signals

- ▶ We have  $\rho_M^* > \rho_E$  if  $w_F > (1 - 2\rho_E)C$
- ▶ Delegated decision-making is preferred if  $\rho_E < \rho_M \leq \rho_M^*$
- ▶ Even if manager's signals are more precise, delegation might be preferred
- ▶ This is because employees having **negative signals**, see **low prospects** of the client producing surplus

## Delegation even if managers have more precise signals

- ▶ We have  $\rho_M^* > \rho_E$  if  $w_F > (1 - 2\rho_E)C$
- ▶ Delegated decision-making is preferred if  $\rho_E < \rho_M \leq \rho_M^*$
- ▶ Even if manager's signals are more precise, delegation might be preferred
- ▶ This is because employees having negative signals, see low prospects of the client producing surplus

⇒ This requires **larger incentives** to exert effort

# Delegation even if managers have more precise signals

- ▶ We have  $\rho_M^* > \rho_E$  if  $w_F > (1 - 2\rho_E)C$
- ▶ Delegated decision-making is preferred if  $\rho_E < \rho_M \leq \rho_M^*$
- ▶ Even if manager's signals are more precise, delegation might be preferred
- ▶ This is because employees having negative signals, see low prospects of the client producing surplus

⇒ This requires larger incentives to exert effort

⇒ **Higher wages** are paid

## Delegation even if managers have more precise signals

- ▶ We have  $\rho_M^* > \rho_E$  if  $w_F > (1 - 2\rho_E)C$
- ▶ Delegated decision-making is preferred if  $\rho_E < \rho_M \leq \rho_M^*$
- ▶ Even if manager's signals are more precise, delegation might be preferred
- ▶ This is because employees having negative signals, see low prospects of the client producing surplus
- ⇒ This requires larger incentives to exert effort
- ⇒ Higher wages are paid, **reducing profits** of investment banks

## Delegation even if managers have more precise signals

- ▶ We have  $\rho_M^* > \rho_E$  if  $w_F > (1 - 2\rho_E)C$
- ▶ Delegated decision-making is preferred if  $\rho_E < \rho_M \leq \rho_M^*$
- ▶ Even if manager's signals are more precise, delegation might be preferred
- ▶ This is because employees having negative signals, see low prospects of the client producing surplus
- ⇒ This requires larger incentives to exert effort
- ⇒ Higher wages are paid, reducing profits of investment banks

## ■ Problem and model assumptions

## ■ Delegated decision-making

## ■ Centralised decision-making

## ■ Summary

# Optimal delegation of decisions

# Optimal delegation of decisions

- Delegation of decisions is optimal if employees are **better informed**

# Optimal delegation of decisions

- ▶ Delegation of decisions is optimal if employees are better informed
- ▶ Even if they are **not** better informed, delegation might be optimal

# Optimal delegation of decisions

- ▶ Delegation of decisions is optimal if employees are better informed
- ▶ Even if they are not better informed, delegation might be optimal
- ▶ If employees receive negative signals on the prospects of the client, they are more **difficult to incentivise** to exert effort

# Optimal delegation of decisions

- ▶ Delegation of decisions is optimal if employees are better informed
- ▶ Even if they are not better informed, delegation might be optimal
- ▶ If employees receive negative signals on the prospects of the client, they are more difficult to incentivise to exert effort
- ▶ If these required additional incentives are large enough, then profits of investment banks are **higher** with delegation

# Optimal delegation of decisions

- ▶ Delegation of decisions is optimal if employees are better informed
- ▶ Even if they are not better informed, delegation might be optimal
- ▶ If employees receive negative signals on the prospects of the client, they are more difficult to incentivise to exert effort
- ▶ If these required additional incentives are large enough, then profits of investment banks are higher with delegation

# Delegated decisions in investment banks

# Delegated decisions in investment banks

- ▶ Investment banks rely on the **knowledge** of their staff

## Delegated decisions in investment banks

- ▶ Investment banks rely on the knowledge of their staff and need to **motivate** them to use this knowledge

## Delegated decisions in investment banks

- ▶ Investment banks rely on the knowledge of their staff and need to motivate them to use this knowledge
- ▶ Imposing decisions that employees **disagree** with, is costly and can reduce profits

## Delegated decisions in investment banks

- ▶ Investment banks rely on the knowledge of their staff and need to motivate them to use this knowledge
- ▶ Imposing decisions that employees disagree with, is costly and can reduce profits
- ▶ Often it is **preferable** to delegate decisions to maintain incentives to exert effort

## Delegated decisions in investment banks

- ▶ Investment banks rely on the knowledge of their staff and need to motivate them to use this knowledge
- ▶ Imposing decisions that employees disagree with, is costly and can reduce profits
- ▶ Often it is preferable to delegate decisions to maintain incentives to exert effort even if managers are **better informed**

## Delegated decisions in investment banks

- ▶ Investment banks rely on the knowledge of their staff and need to motivate them to use this knowledge
- ▶ Imposing decisions that employees disagree with, is costly and can reduce profits
- ▶ Often it is preferable to delegate decisions to maintain incentives to exert effort even if managers are better informed
- ▶ Investment banks typically **delegate** decisions more than many other organisations

## Delegated decisions in investment banks

- ▶ Investment banks rely on the knowledge of their staff and need to motivate them to use this knowledge
- ▶ Imposing decisions that employees disagree with, is costly and can reduce profits
- ▶ Often it is preferable to delegate decisions to maintain incentives to exert effort even if managers are better informed
- ▶ Investment banks typically delegate decisions more than many other organisations
